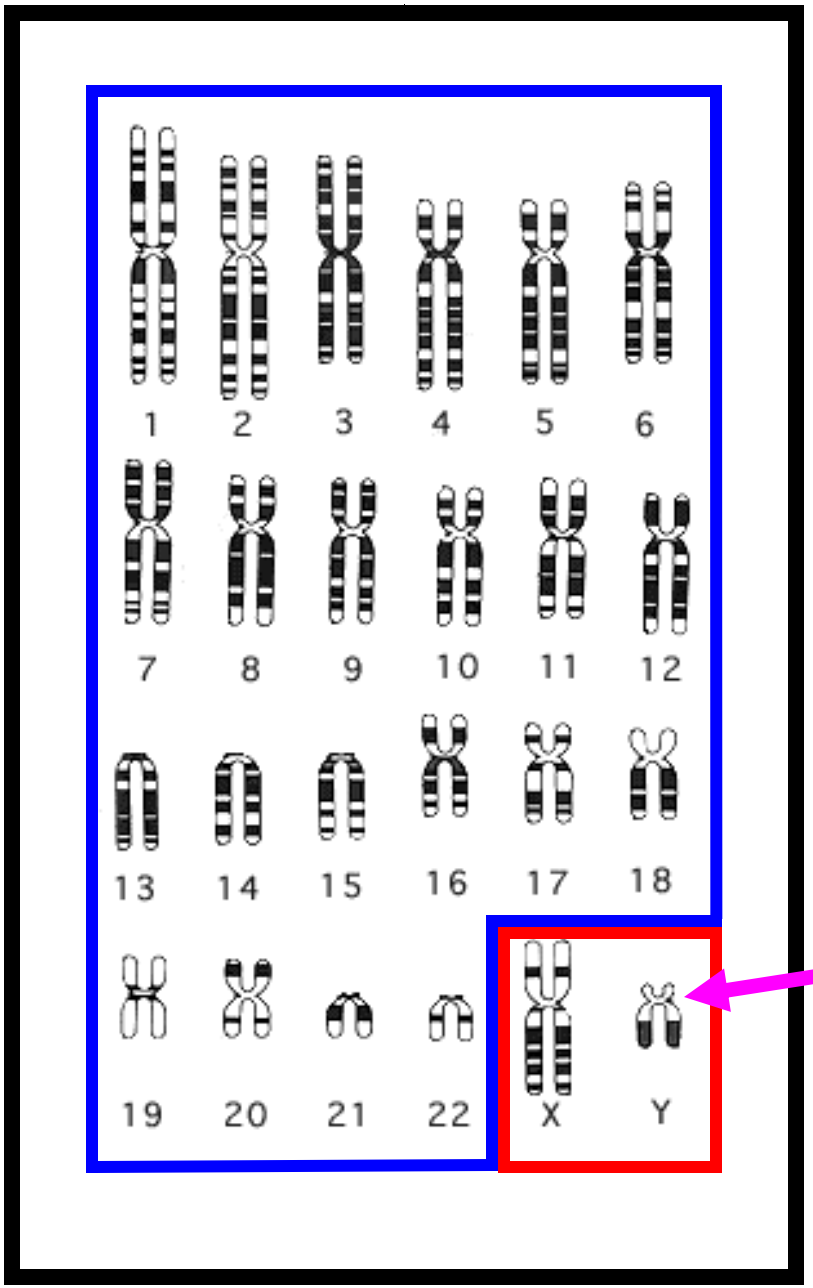
Lineage Markers:
Y-STRs, mtDNA, and X-STRs

John M. Butler

NIST
National Institute of Standards and Technology

NIST Applied Genetics Group
National Institute of Standards and Technology
Gaithersburg, Maryland

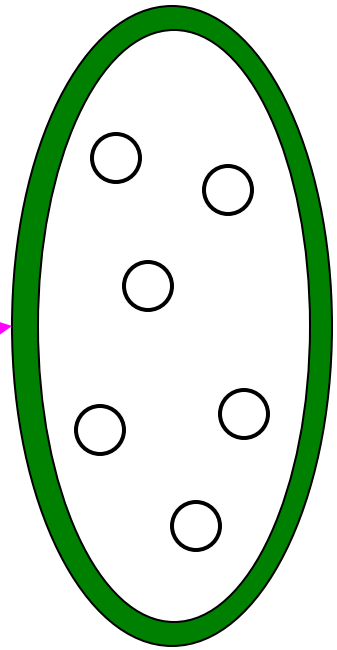
Cell Nucleus – 3.2 billion bp



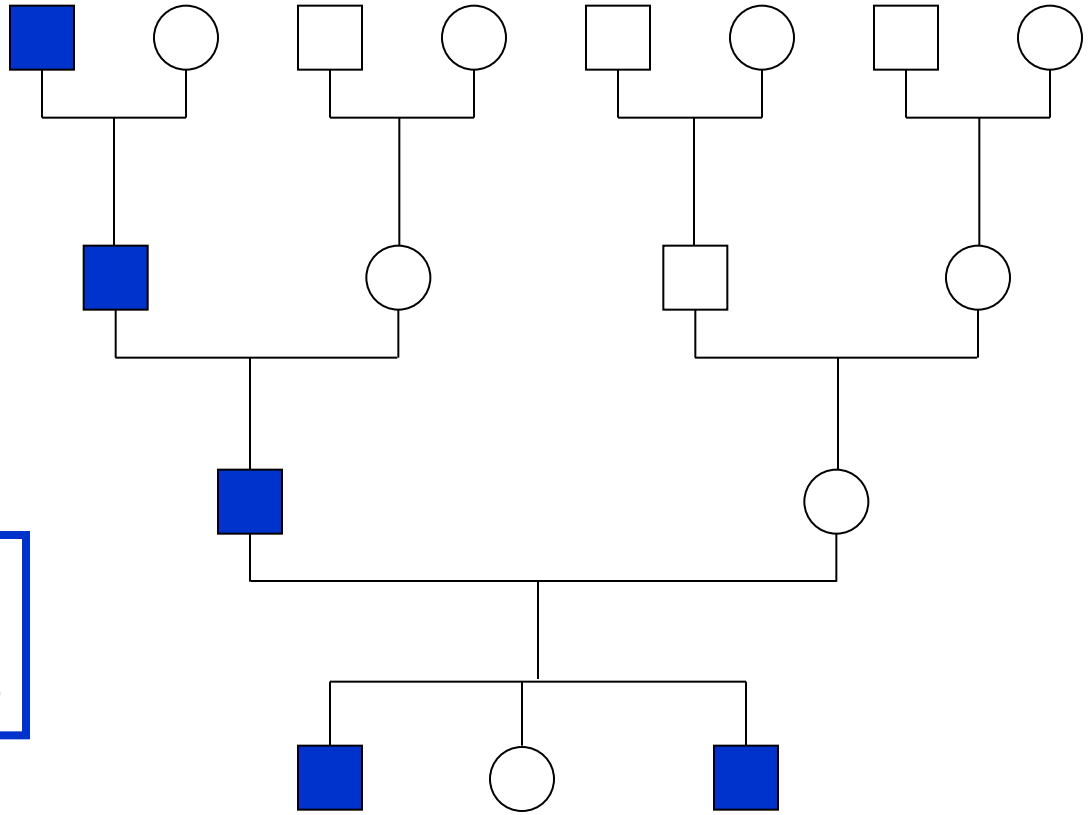
Autosomes – 22 pairs – 2 copies per cell

Sex Chromosomes (XX or XY)

mitochondria – in cell cytoplasm
100s of mtDNA copies per cell



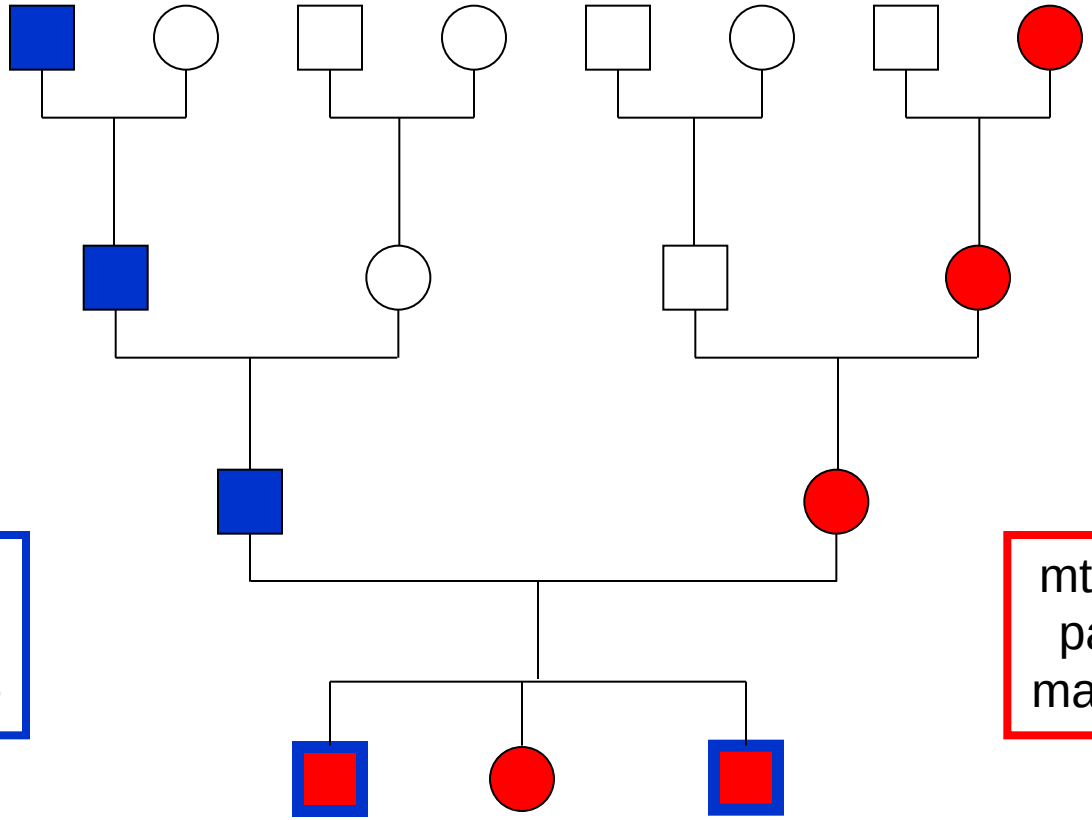
Lineage Markers: Y-Chromosome



Y chromosome passed along paternal lineage

Autosomal DNA
1/8 from Great-grandparents

Lineage Markers: mtDNA



Y chromosome passed along paternal lineage

mtDNA genome passed along maternal lineage

Autosomal DNA
1/8 from Great-grandparents

Different Inheritance Patterns

TABLE 15.1 Specific Relationships and the Probability of Transmitting Genetic Information (Barring Mutation). Some of the ChrY Information is Not Applicable (N/A) as Women Do Not Have a Y-Chromosome.

Inheritance	Autosomal Markers	ChrY Markers	mtDNA	ChrX Markers
Mother → Son	50%	N/A	100%	100%
Mother → Daughter	50%	N/A	100%	50%
Father → Son	50%	100%	0%	0%
Father → Daughter	50%	0%	0%	100%
Paternal Grandmother → Granddaughter	25%	N/A	0%	100%
Maternal Grandmother → Granddaughter	25%	N/A	100%	25%
Paternal Grandfather → Grandson	25%	100%	0%	0%

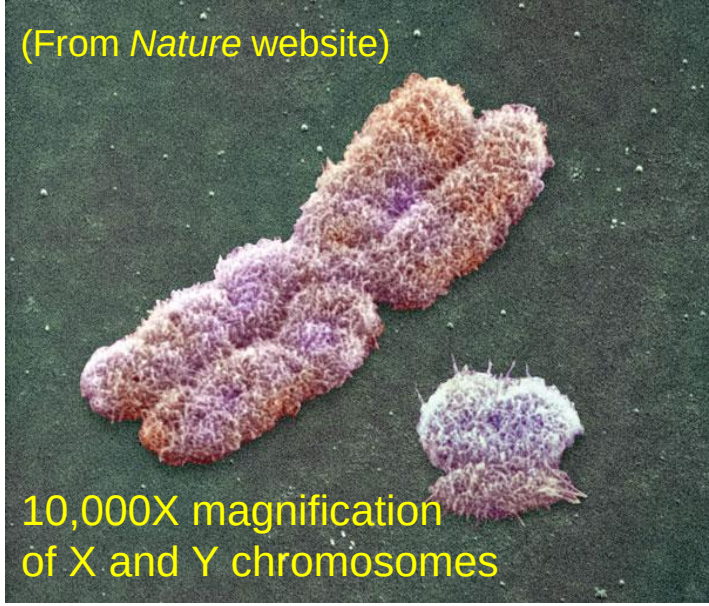
THE HUMAN Y CHROMOSOME: AN EVOLUTIONARY MARKER COMES OF AGE

Mark A. Jobling & Chris Tyler-Smith

Nature Reviews Genetics (2003) 4, 598-612



Abstract

- **Until recently, the Y chromosome seemed to fulfill the role of juvenile delinquent among human chromosomes — rich in junk, poor in useful attributes, reluctant to socialize with its neighbors and with an inescapable tendency to degenerate. The availability of the near-complete chromosome sequence, plus many new polymorphisms, a highly resolved phylogeny and insights into its mutation processes, now provide new avenues for investigating human evolution. Y-chromosome research is growing up.**

What has happened in the past decade…

- **Selection of core Y-STR loci** (SWGDAM Jan 2003)
- "Full" Y-chromosome sequence became available in June 2003; over 400 Y-STR loci identified (only ~20 in 2000)
- **Commercial Y-STR kits released**
  - ~~Y-PLEX 6,5,12 (2001-03)~~, **PowerPlex Y** (9/03), **Yfiler** (12/04), **PPY23** (6/12)
- Many population studies performed and online databases generated with thousands of Y-STR haplotypes
- Forensic casework demonstrations showing value of Y-STR testing along with court acceptance
- Some renewed interest in Y-STRs to aid familial searching

Y-STR Information

- Why the Y?
- Y-STR Loci & Kits
- Y-STR Databases
- Y-STR Stats & Interpretation Issues
- Genetic Genealogy & Familial Searching

Value of Y-Chromosome Markers

J.M. Butler (2005) *Forensic DNA Typing*, 2nd Edition; Table 9.1

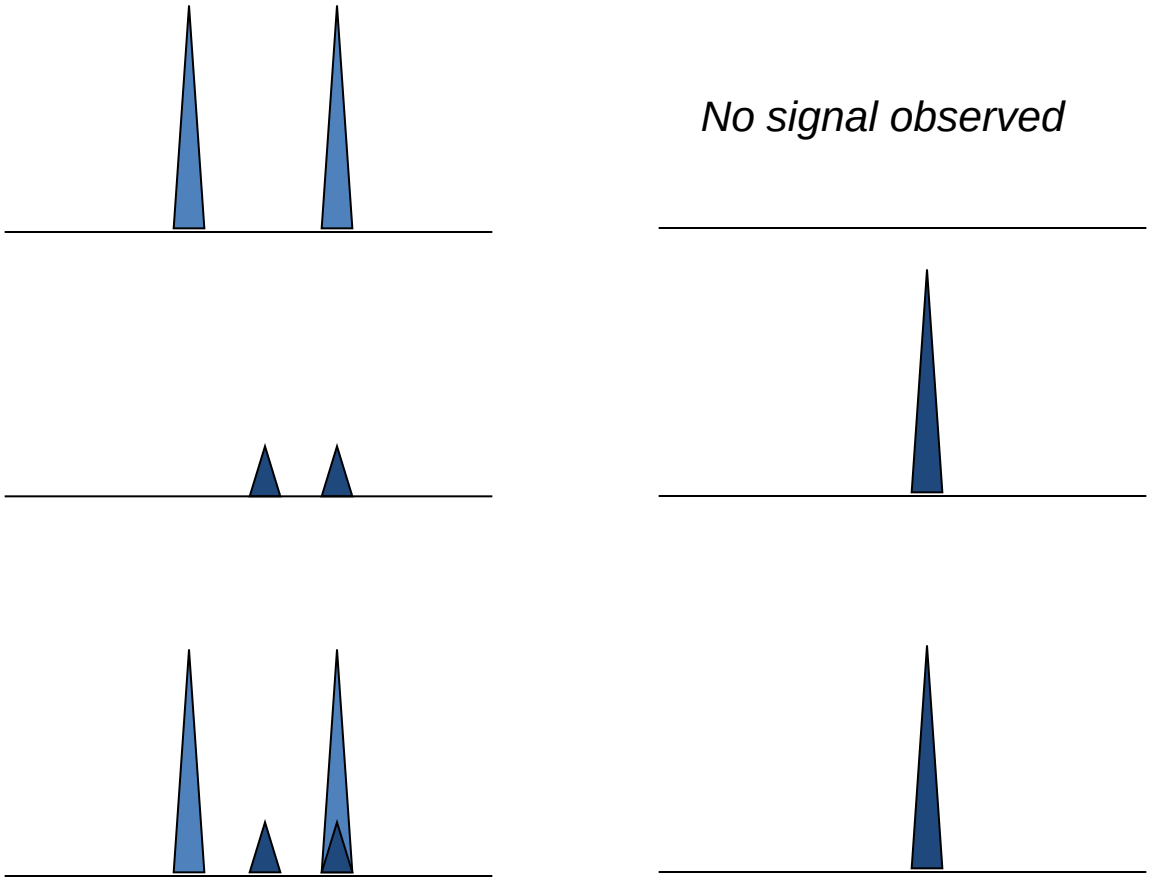
Application	Advantage
Forensic casework on sexual assault evidence	**Male-specific amplification** (can avoid differential extraction to separate sperm and epithelial cells)
Paternity testing	Male children can be tied to fathers in motherless paternity cases
Missing persons investigations	**Patrilineal male relatives may be used for reference samples**
Human migration and evolutionary studies	Lack of recombination enables comparison of male individuals separated by large periods of time
Historical and genealogical research	Surnames usually retained by males; can make links where paper trail is limited

Y-STRs can permit simplification of male DNA identification in sexual assault cases

Female Victim DNA Profile

Male Perpetrator DNA Profile

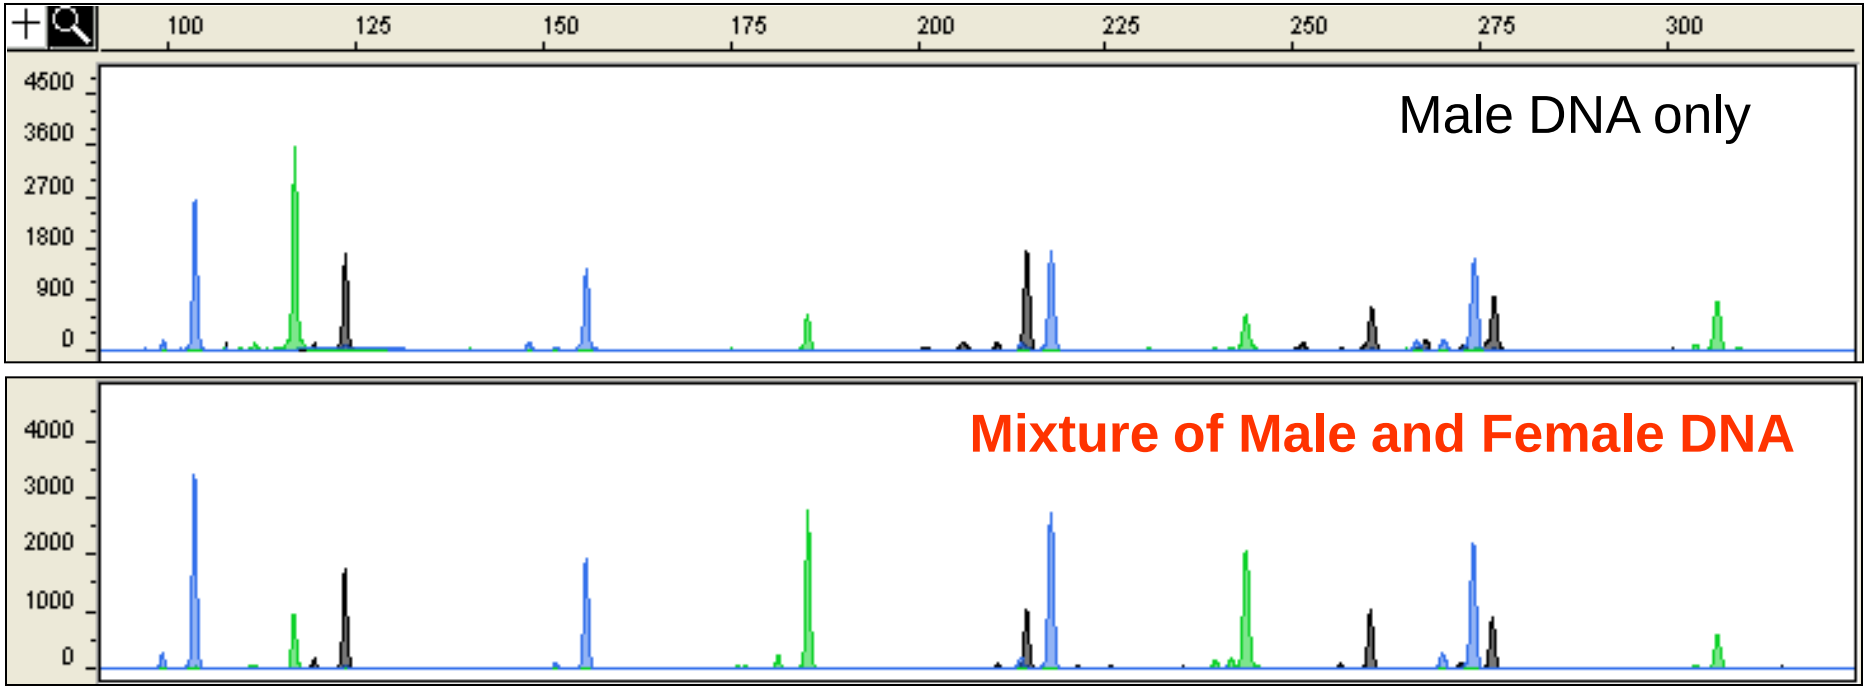
DNA Profile from Crime Scene



Autosomal STR Profile

Y-Chromosome STR Profile

Y-STRs Identify the Male Component even with Excess Female DNA



800X female DNA

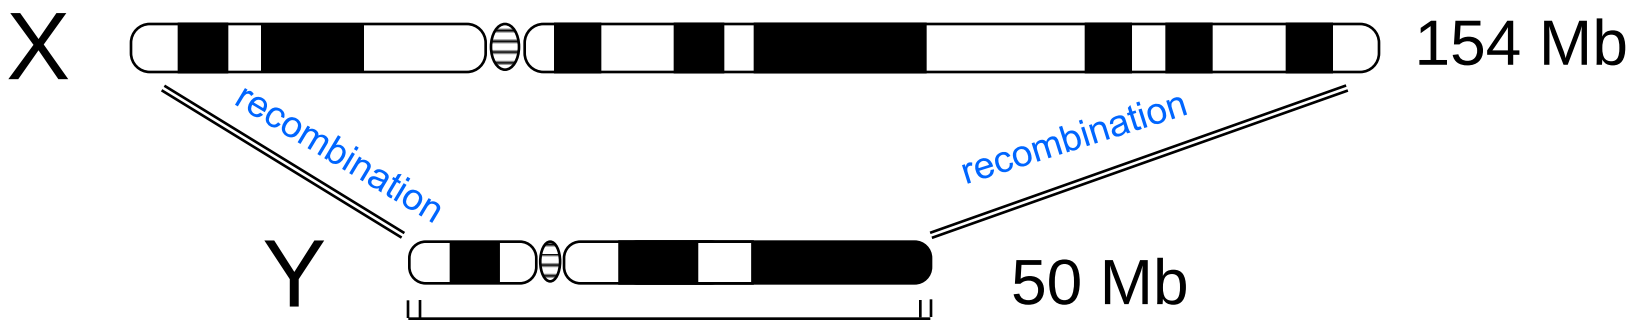
Disadvantages of the Y-Chromosome

- Loci are not independent of one another and therefore rare random match probabilities cannot be generated with the product rule; must use haplotypes (combination of alleles observed at all tested loci)

- **Paternal lineages possess the same Y-STR haplotype** (barring mutation) and thus fathers, sons, brothers, uncles, and paternal cousins cannot be distinguished from one another

- Not as informative as autosomal STR results
  - **More like addition (10 + 10 + 10 = 30) than multiplication (10 x 10 x 10 = 1,000)**

X- and Y-Chromosomes Recombine at Their Tips



Male-specific region of the Y (MSY)

Focus in Forensics is on the NRY

PCR primers for Y-STRs need to be carefully designed to avoid X-chromosome homology

Recent Developments with Y-STR Typing

- **Promega Corporation** plans to release **PowerPlex Y23** (23 loci) in June 2012 which will enable further resolution of Y-STR haplotypes
  - Population databases will need to be developed with the new extended haplotypes

- Manfred Kayser's group has developed a set of **rapidly mutating (RM) Y-STR loci** that have the capability to resolve fathers and sons in many instances
  - An international collaboration is currently on-going to study these RM Y-STRs in more detail (14 RM Y-STRs in 3 multiplexes)

Standards and Guidelines

Y-chromosome Short Tandem Repeat (Y-STR) Interpretation Guidelines

Scientific Working Group on DNA Analysis Methods (SWGDAM)

Introduction | Preliminary Evaluation of Data | Designation | Interpretation of Results | Conclusions and Reporting | Statistical Interpretation | References/Suggested Readings

Introduction

The interpretation of the results of casework is a matter of professional judgment and expertise. Not every situation can or should be covered by a preset rule. It is

Will likely be updated soon to reflect change to Clopper-Pearson…

http://www.fbi.gov/about-us/lab/forensic-science-communications/fsc/jan2009/standards/2009_01_standards01.htm/

Results of Y-STR Profile Search

The following profile was searched on 15 January 2011 against several databases: DYS19 (14), DYS389I (13), DYS398II (29), DYS390 (24), DYS391 (11), DYS392 (13), DYS393 (13), DYS385 a/b (11,15), DYS438 (12), DYS439 (13), DYS437 (15), DYS448 (19), DYS456 (17), DYS458 (18), DYS635 (23), and GATA-H4 (12).

Database	Minimal haplotype (9 loci)	SWGDAM (11 loci)	PowerPlex Y (12 loci)	Yfiler (17 loci)	3/N for zero observations
YHRD	403/89804 = 0.45 %	29/62548 = 0.046 %	14/42277 = 0.033 %	0/30300 = <0.0033 %	3/30300 = 0.0099 %
US Y-STR	6/18547 = 0.032 %	1/18547 = 0.0054 %	1/15223 = 0.0066 %	0/8376 = <0.012 %	3/8376 = 0.036 %
Yfiler database	64/11393 = 0.56 %	4/11393 = 0.035 %	4/11393 =0.035 %	0/11393 = <0.0088 %	3/11393 = 0.026 %

Normal vs. Clopper-Pearson

In March 2010 the US Y-STR database changed its 95 % confidence interval calculations to the Clopper-Pearson method.

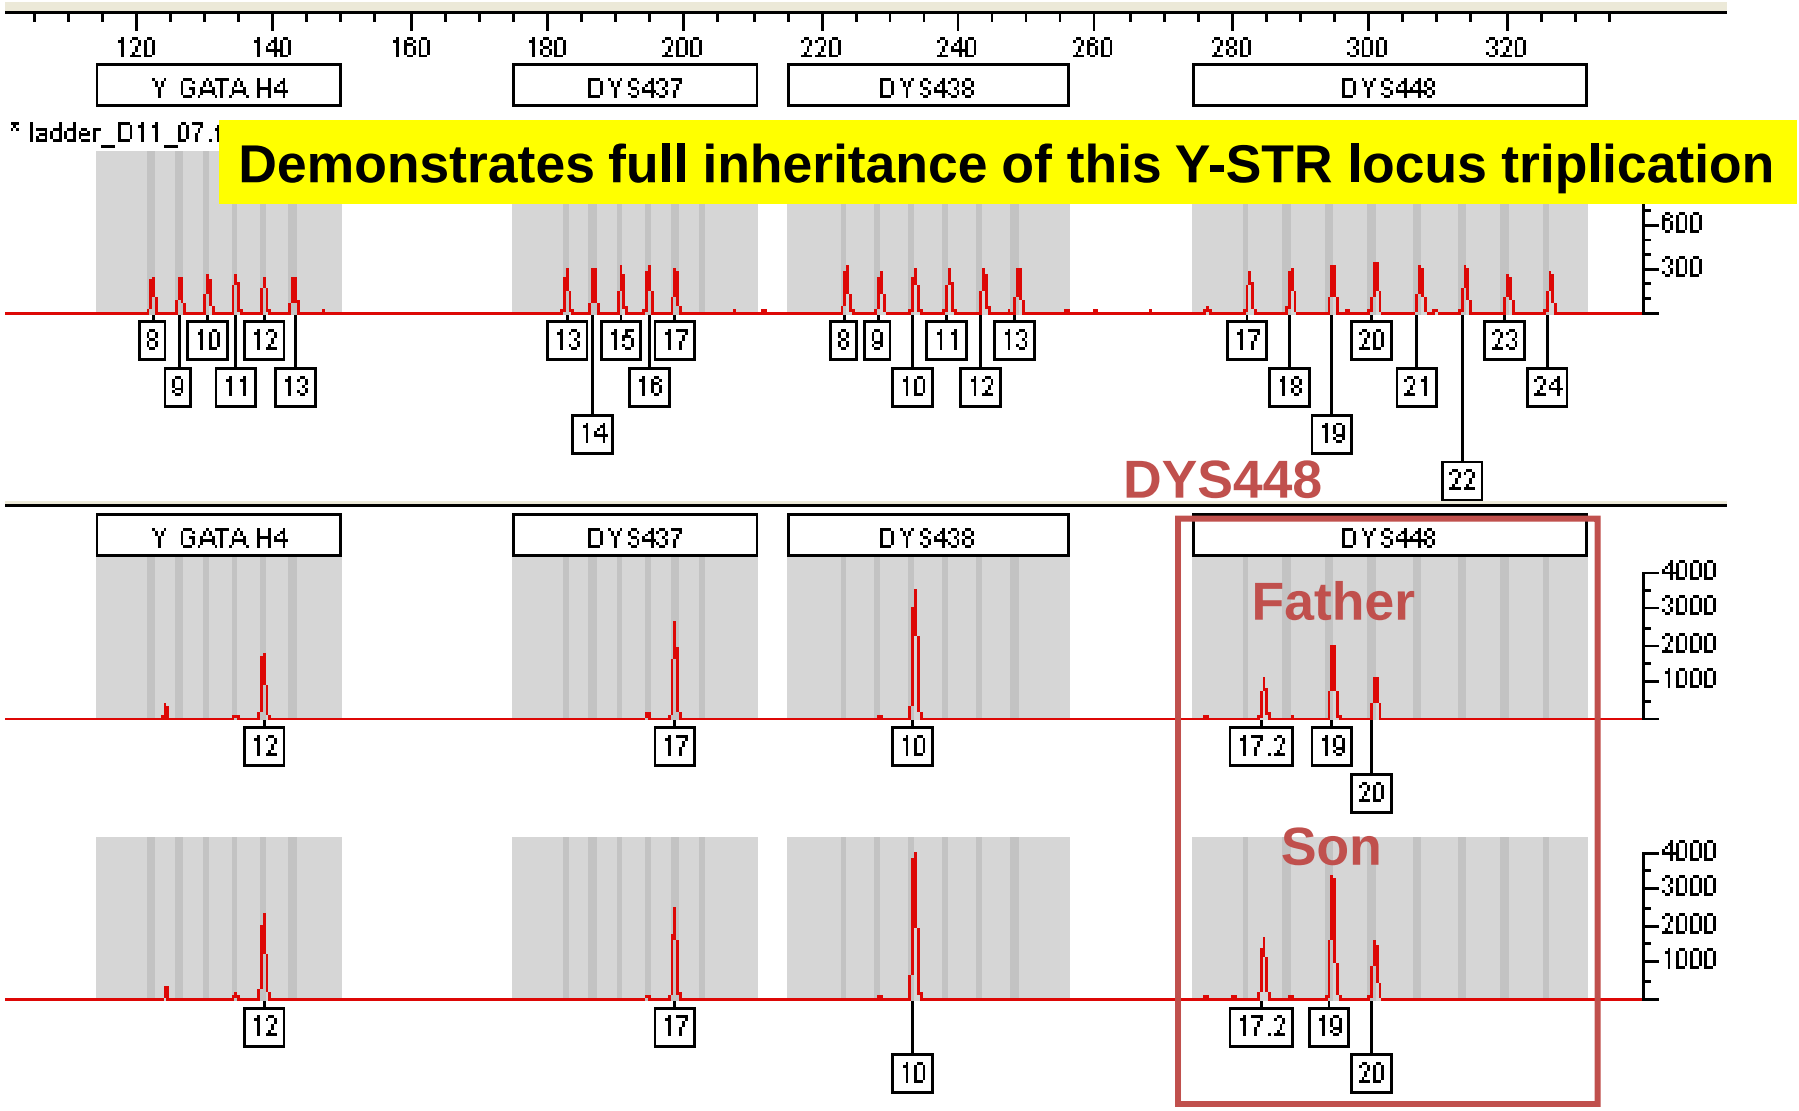
Count values	**Frequency** p = x/N	**Normal 95 % confidence interval**	**Clopper-Pearson** 95 % confidence interval*
YHRD 9 loci: **403**/89804	0.449 %	0.485 %	**0.487 %**
YHRD 12 loci: **14**/42277	0.0331 %	0.0477 %	**0.0518 %**
US Y-STR 12 loci: **1**/15223	0.0657 %	0.0174 %	**0.0317 %**

* Calculation performed with HaploCALc_1.0 Excel spreadsheet kindly provided by Steven P. Myers, CA DOJ

Note that with a large number of observations, such as 403 out of a database of 89804, there is almost no difference between the normal and Clopper-Pearson approaches. However, the normal method is less conservative (i.e., provides a more rare frequency) when the haplotype frequency is low, such as 1 out of 15223 or even 14 out of 42277. Although there are differences in these calculations, re-evaluation by the Clopper-Pearson method will not suddenly change a reported result by orders of magnitude or likely change the outcome of a report significantly.

DYS448 Triplication

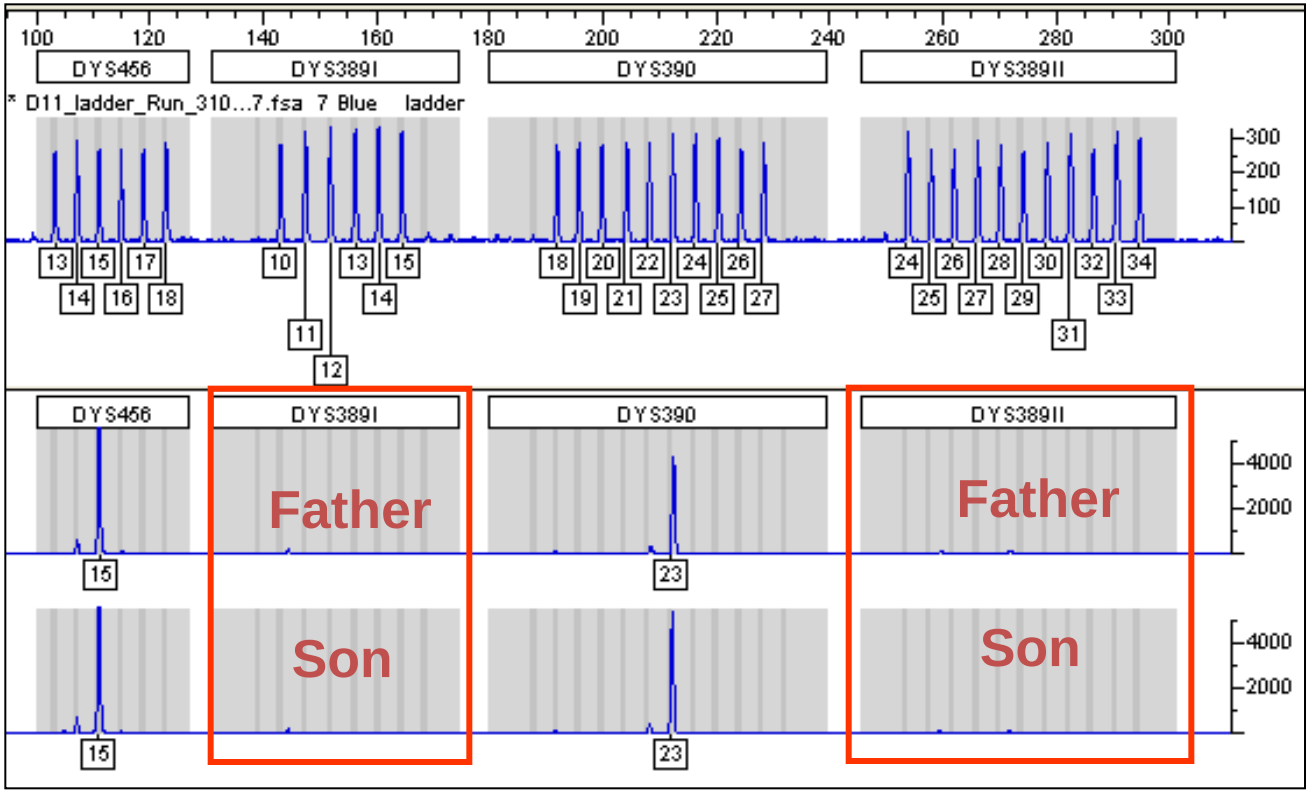
Seen in Both Father and Son

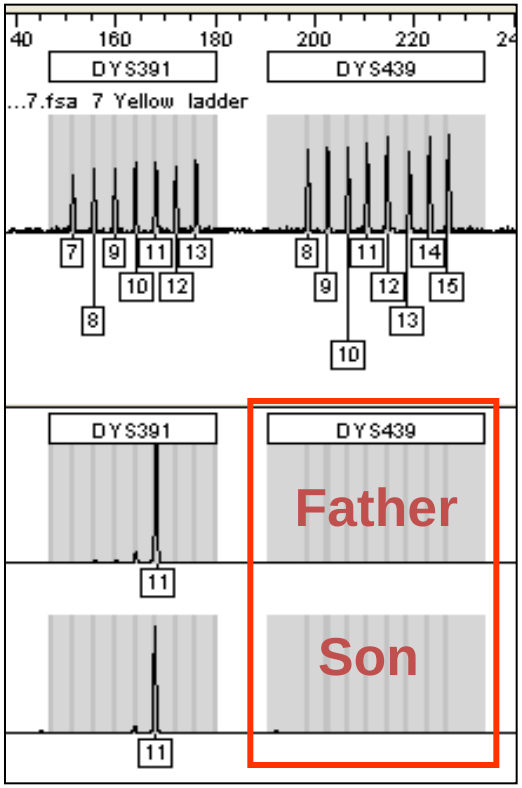


DYS389I, DYS389II, DYS439 Deletions

Seen in Both Father and Son

Yfiler data



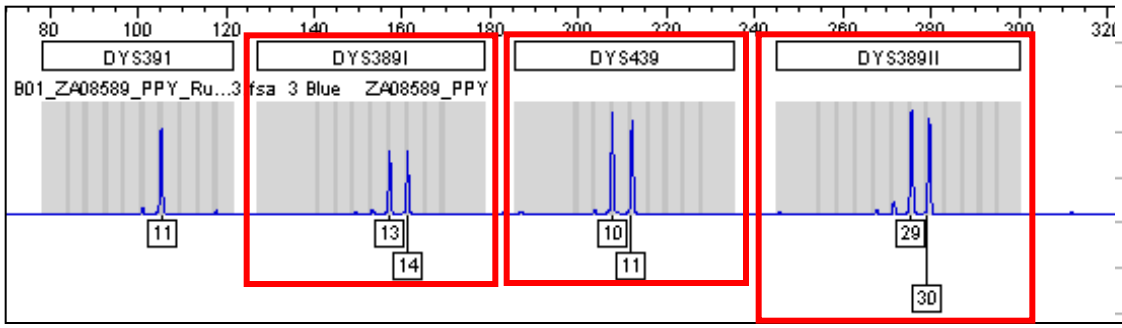


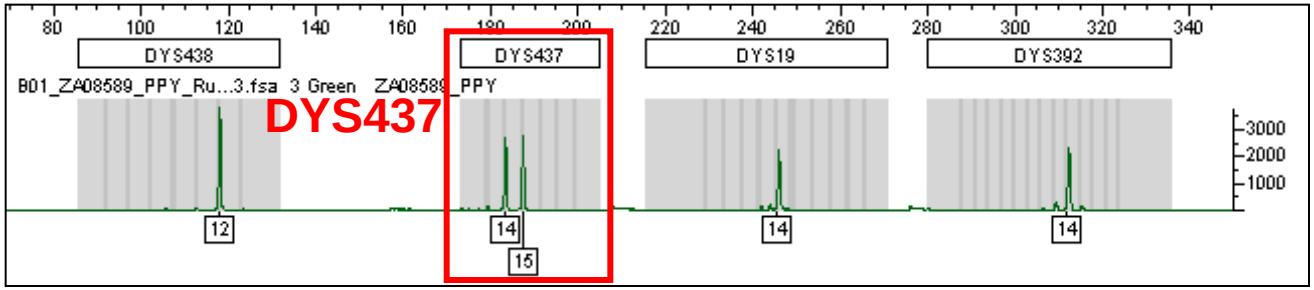
DYS389I **DYS389II** **DYS439**

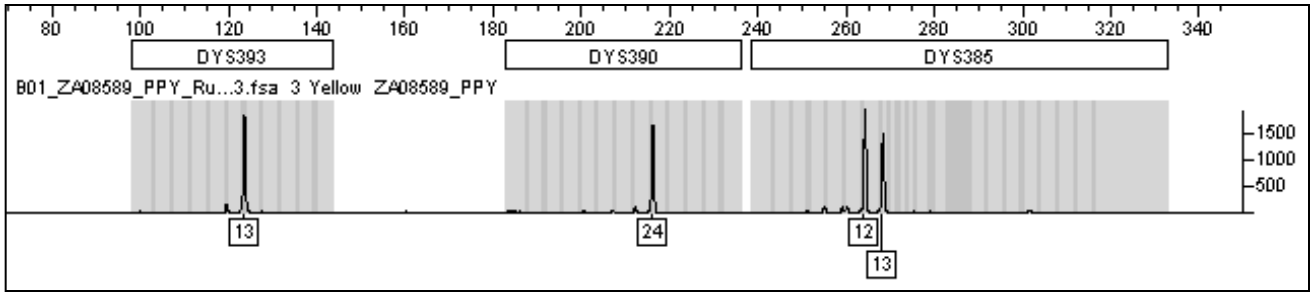
Full inheritance of these Y-STR locus deletions

Duplication at Multiple Loci with Single-Source Sample

PowerPlex Y data







Y-chromosome mapping

q-arm

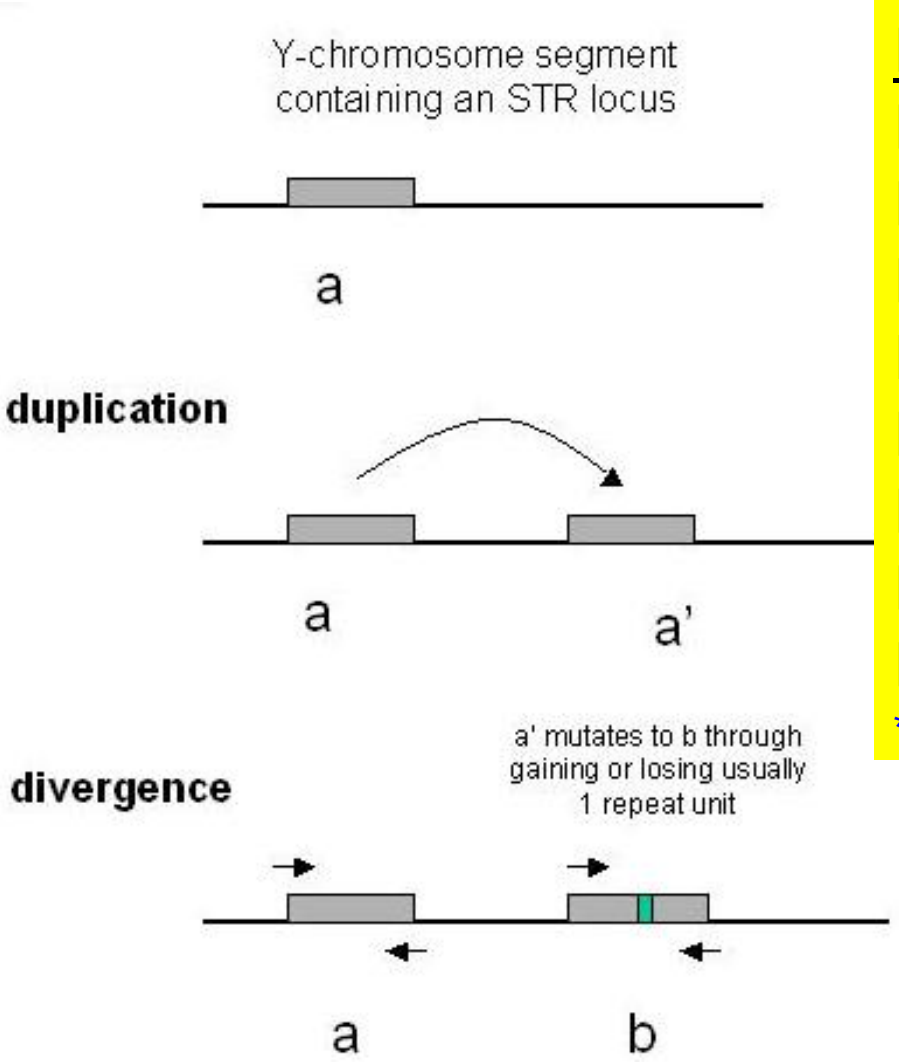
Y STR Marker	Position (Mb)
DYS391	13.413
DYS635 (C4)	13.690
DYS434	13.777
DYS437	13.778
DYS435	13.807
DYS439	13.826
DYS389 I/II	13.923
DYS388	14.057
DYS442	14.071
DYS438	14.248

Entire region of Y-chromosome has likely been duplicated and then diverged

Most duplications have a single repeat spread in allele patterns

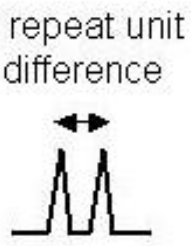
Butler et al. (2005) Chromosomal duplications along the Y-chromosome and their potential impact on Y-STR interpretation *J. Forensic Sci.* 50(4): 853-859

Duplication and Divergence Model



Locus	# dup*	>1 repeat
DYS19	23	2
DYS389I	5	0
DYS389II	9	2
DYS390	1	0
DYS391	3	1
DYS392	0	0
DYS393	3	0
DYS385a/b	17	0

*from www.yhrd.org, literature, and our work



92% have single repeat difference

Since single-step mutations are most common, then single repeat spacing in duplicated alleles is expected

Butler et al. (2005) Chromosomal duplications along the Y-chromosome and their potential impact on Y-STR interpretation *J. Forensic Sci.* 50(4): 853-859

Deciphering between a Mixture of Multiple Males and Locus Duplication

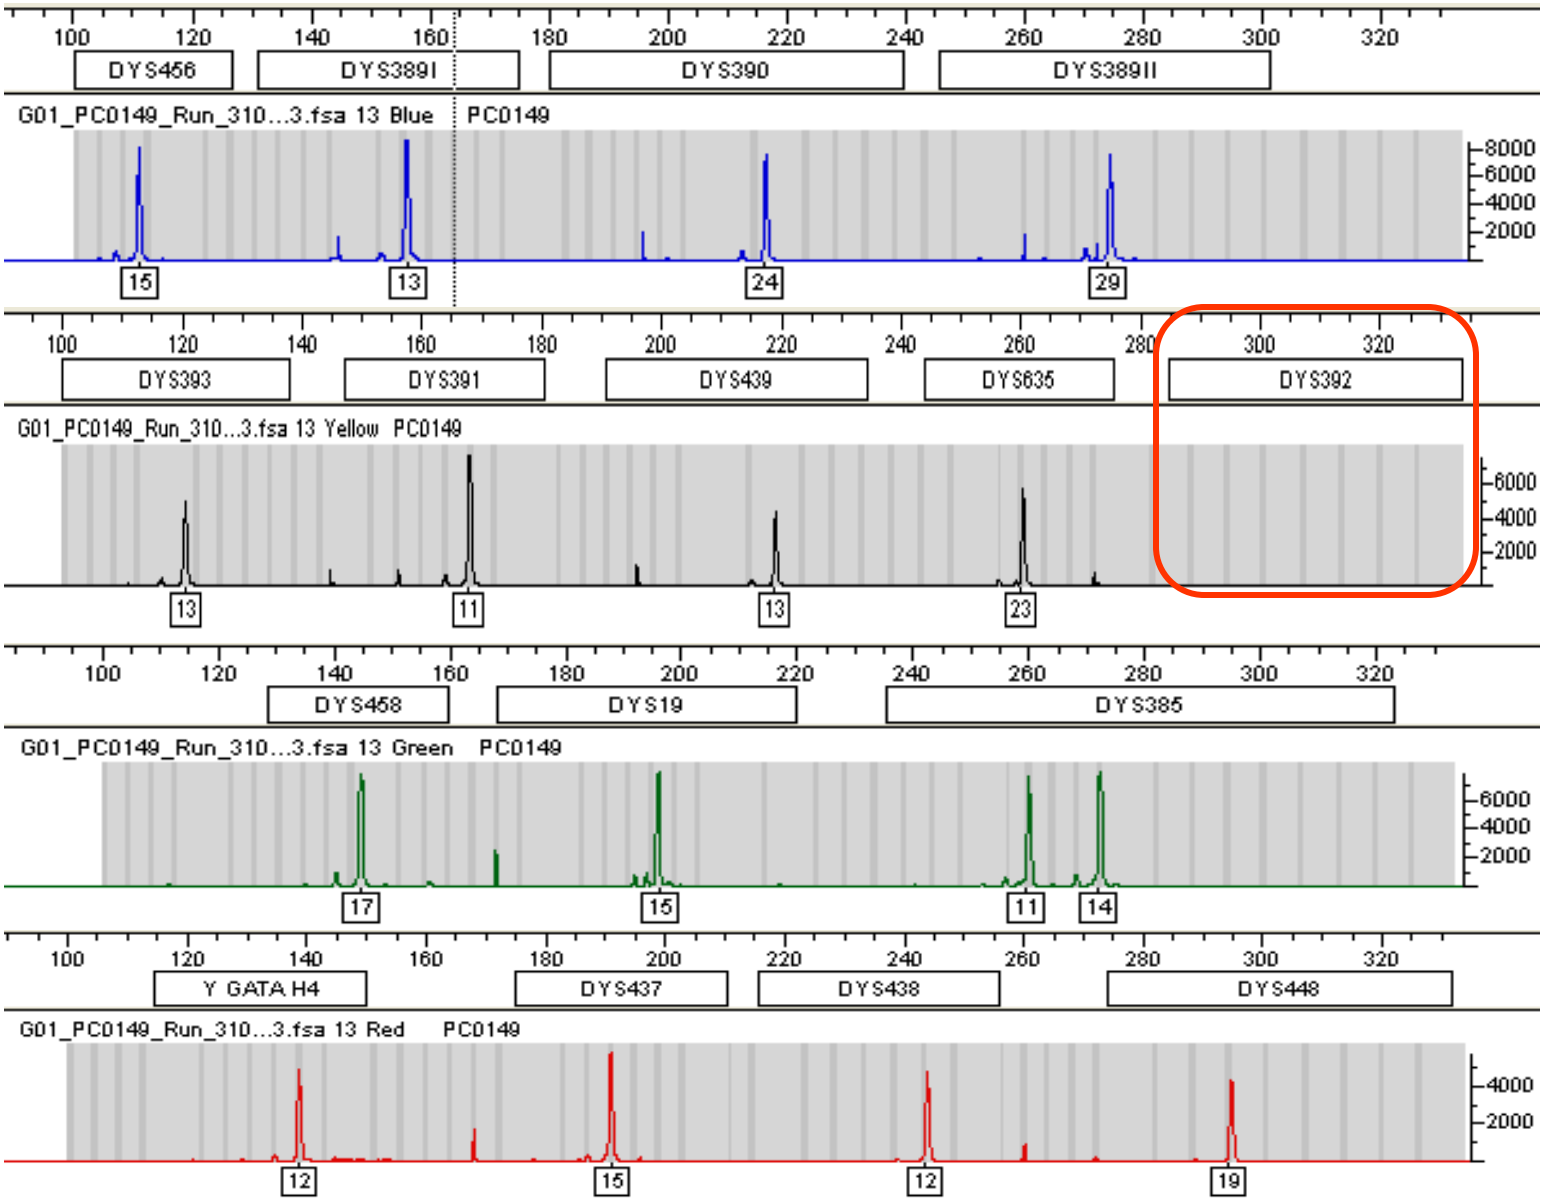
- ***Note the number of loci containing >1 allele (other than multi-copy DYS385)***
- ***Consider relative position on the Y-chromosome if multiple loci have two alleles***
- ***See if repeat spread is >1 repeat unit***
- ***Examine DYS385 for presence of >2 alleles***

Locus duplication along the Y-chromosome is in many ways analogous to heteroplasmy in mitochondrial DNA, which depending on the circumstances can provide greater strength to a match between two DNA samples.

Butler et al. (2005) Chromosomal duplications along the Y-chromosome and their potential impact on Y-STR interpretation *J. Forensic Sci.* 50(4): 853-859

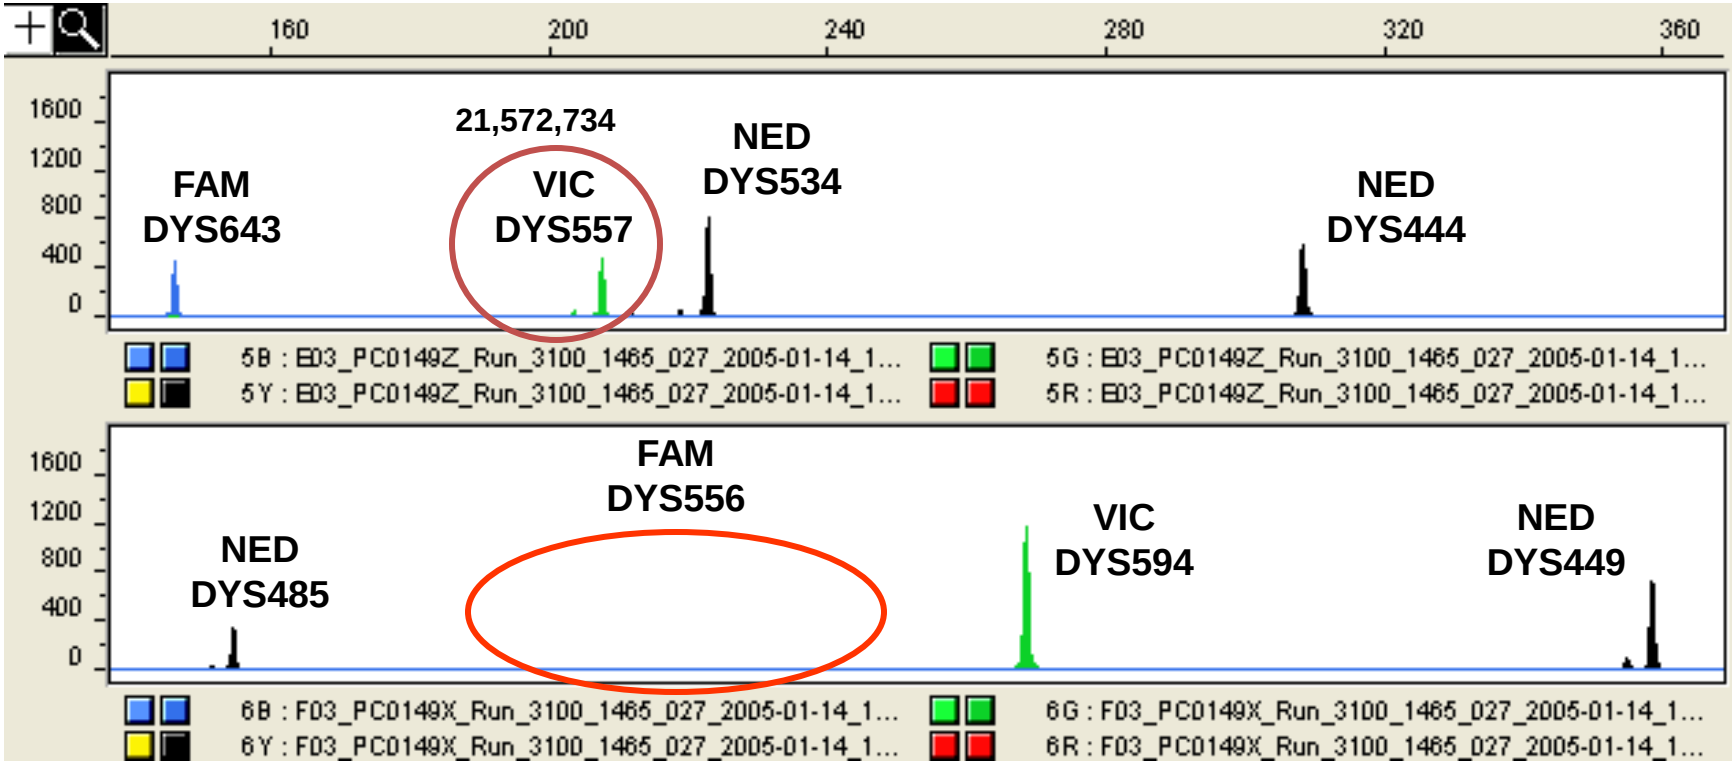
Sample PC0149 with Yfiler

DYS392 is deleted



PC0149 with Additional Y-STRs

One of the closest available loci fails



DYS556 ~32,000 bp away from DYS392 is **missing**

DYS557 ~600,000 bp away from DYS392 is present

Practical Information on Y Deletions

- If DYS458 is deleted in Yfiler, then your sample is likely to lack an Amelogenin Y amplicon as DYS458 and AMEL Y are 1.13 Mb apart on the short arm of the human Y-chromosome
  - Chang *et al.* (2007) *Forensic Sci. Int*. 166: 115-120

- Many Y-chromosomes are more complicated than originally thought!

Y-STR Summary

- Mutation rates are similar to autosomal STRs (~0.2%) – based on father-son studies
- Variant alleles are observed as in autosomal STRs due to flanking region mutations, etc.
- Regions of the Y-chromosome can be duplicated or deleted causing Y-STRs to be duplicated or deleted
- Careful primer design is important to avoid X-chromosome homology or Y-chromosome duplications

Standardization is Critical for Success and Data Sharing

Needs	How/When Accomplished
Core Y-STR loci	SWGDAM Y-STR Committee selected 11-loci in January 2003
Consistent allele nomenclature	NIST SRM 2395 (2003); kit allelic ladders; ISFG (2006) and NIST (2008) publications
Commercially available Y-STR kits	Early ReliaGene kits (2001-2003); **PowerPlex Y** (2003) and **Yfiler** (2004) **PowerPlex Y23** (2012)
Accessible, searchable population databases for haplotype frequency estimations	**YHRD** (72,171 11-locus haplotypes from 750 worldwide populations) **US YSTR** (18,719 11-locus haplotypes from primarily U.S. population groups)
Interpretation guidelines	SWGDAM Y-STR Interpretation Guidelines published in January 2009 (*will likely be revised soon*)

Predictions for **the Future** of Y-STR Analysis

- Continued use with casework (with excess female DNA)

- Improved frequency estimates with growing Y-STR databases
  - YHRD now at **70,997 11-locus profiles** (39,339 Yfiler)
  - USYSTR has **18,719 11-locus profiles** (8,548 Yfiler)

- Use with familial searching to eliminate false positives
  - Myers, S.P. et al. (2011) *FSI Genetics* 5(5): 493-500 – describes CA DOJ familial searching

- **New Y-STR kits with additional loci**
  - At the ISHI meeting, Promega announced a Y-STR 23plex was being developed
  - Will take time though to grow large population databases that cover all of the new loci

- Use of fast mutating loci to help resolve paternal lineages (e.g., to separate brothers or father/son haplotypes)
  - Ballantyne, K.N. et al. (2010) *Am J Hum Genet* 87(3): 341-353
  - Ballantyne, K.N. et al. (2012) *FSI Genetics* (*in press*)

- **In some cases, being able to put a lineage name to an unknown Y-STR profiles using on-line genetic genealogy information**

Provides coverage of **17 Yfiler loci** and **6 additional loci** in **PowerPlex Y23 loci**

Expected Number of Y-STR Differences with Various Levels of Relatedness Between Tested Males

	12 loci	25 loci	37 loci	67 loci	111 loci	Interpretation
Very Tightly Related	N/A	N/A	0	0	0	Your exact match means your relatedness is extremely close. Few people achieve this close level of a match. All confidence levels are well within the time frame that surnames were adopted in Western Europe.
Tightly Related	N/A	N/A	1	1-2	1-2	Few people achieve this close level of a match. All confidence levels are well within the time frame that surnames were adopted in Western Europe.
Related	0	0-1	2-3	3-4	3-5	Your degree of matching is within the range of most well-established surname lineages in Western Europe. If you have tested with the Y-DNA12 or Y-DNA25 test, you should consider upgrading to additional STR markers. Doing so will improve your time to common ancestor calculations.
Probably Related	1	2	4	5-6	6-7	Without additional evidence, it is unlikely that you share a common ancestor in recent genealogical times (1 to 6 generations). You may have a connection in more distant genealogical times (less than 15 generations). If you have traditional genealogy records that indicate a relationship, then by testing additional individuals you will either prove or disprove the connection.
Only Possibly Related	2	3	5	7	8-10	It is unlikely that you share a common ancestor in genealogical times (1 to 15 generations). Should you have traditional genealogy records that indicate a relationship, then by testing additional individuals you will either prove or disprove the connection. A careful review of your genealogical records is also recommended.
Not Related	3	4	6	>7	>10	You are not related on your Y-chromosome lineage within recent or distant genealogical times (1 to 15 generations).

From http://www.familytreedna.com

If two men share a surname, how should the genetic distance at 25 Y-chromosome STR markers be interpreted?

Genetic Distance	Relationship	Interpretation
0	Related	A perfect 25/25 match between two men who share a surname (or variant) means they likely share a common male ancestor within the genealogical time frame. The probability of a close relationship is very high.
1	Related	A 24/25 match between two men who share a surname (or variant) means they likely share a common male ancestor within the genealogical time frame. For most closely related and same surnamed individuals, the mismatch markers are often DYS439, DYS385, DYS389i, DYS389ii, DYS458, DYS459, DYS449, and DYS464 which have shown themselves to move most rapidly.
2	Probably Related	A 23/25 match between two men who share a surname (or variant) means they may share a common male ancestor within the genealogical time frame. The probability of a relationship is good. However, your results show mutations and therefore more time between you and the other same surnamed person. For most closely related and same surnamed individuals, the mismatch markers are often DYS439, DYS385, DYS389i, DYS389ii, DYS458, DYS459, DYS449, and DYS464 which have shown themselves to move most rapidly.

From http://www.familytreedna.com

If two men share a surname, how should the genetic distance at 111 Y-chromosome STR markers be interpreted?

Genetic Distance	Relationship	Interpretation	Related in This Number of Generations or LESS			
			Confidence			
			50%	90%	95%	99%
0	Very Tightly Related	A 111/111 match indicates a very close or immediate relationship. Most exact matches are 3rd cousins or closer, and over half are related within two generations (1st cousins).	2	4	5	6
1	Tightly Related	A 110/111 match indicates a close relationship. Most one-off matches are 5th or more recent cousins, and over half are 2nd cousins or closer.	3	6	7	9
2	Tightly Related	A 109/111 match indicates a close relationship. Most matches are 7th cousins or closer, and over half are 4th or more recent cousins.	5	8	9	11
3	Related	A 108/111 match indicates a genealogical relationship. Most matches at this level are related as 9th cousins or closer, and over half will be 5th or more recent cousins. This is well within the range of traditional genealogy.	6	10	11	14

Statistical Calculations

Statistical Calculations on Y-STR Data

- **Locus (gene) Diversity** = $\mathbf{(n/n-1)(1 - \Sigma p_i^2)}$ where n is the number of samples in the dataset and p_i is the frequency of the i^{th} allele

- **Haplotype Diversity** $\mathbf{(HD) = (n/n-1)(1 - \Sigma p_i^2)}$ where n is the number of samples in the dataset and p_i is the frequency of the i^{th} haplotype

- **Random Match Probability** (RMP) = 1 - HD

- **Discrimination Capacity** (DC) – total number of observed haplotypes divided by the total number of individuals in the dataset

- **Unique Haplotypes** (UH) – number of haplotypes that occur only once in the dataset

Calculating Gene (STR) Diversity

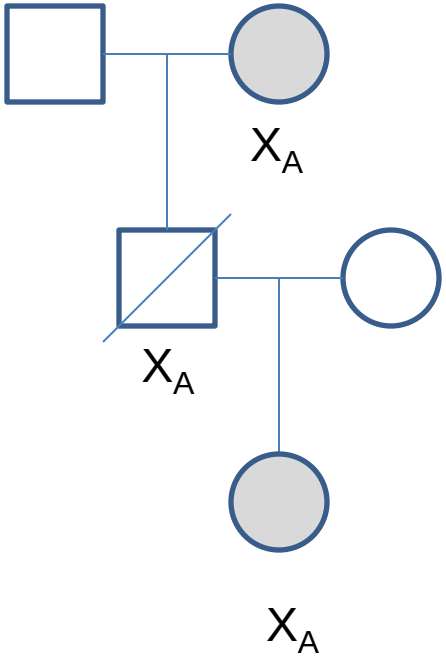
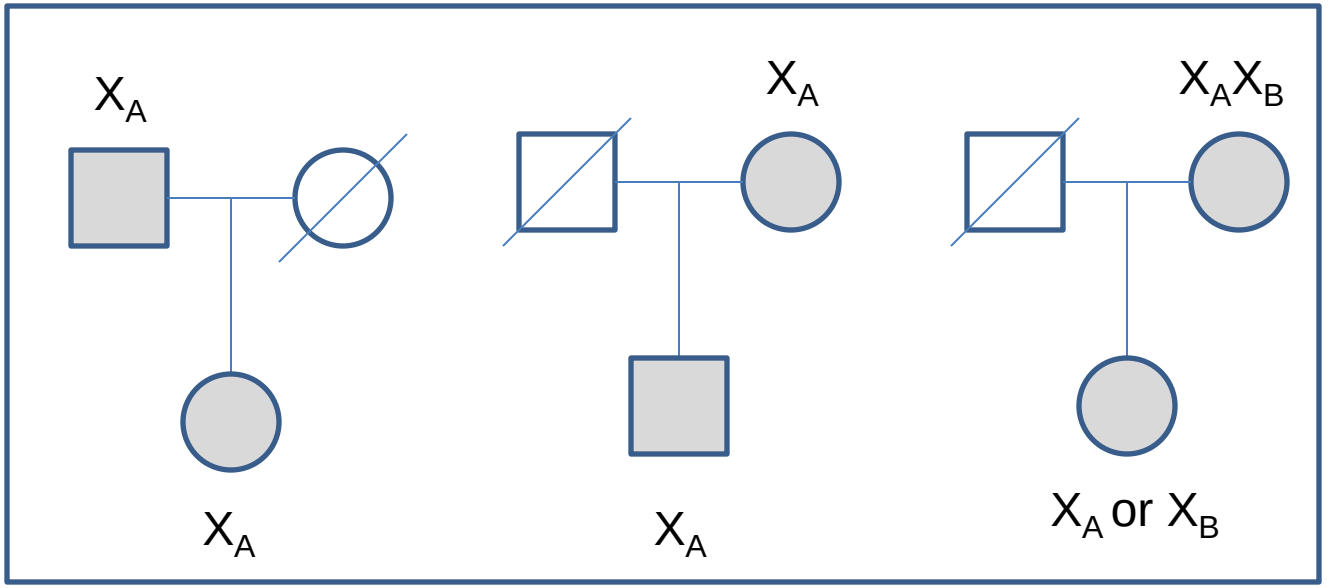
X-Chromosome Markers

Applications of X-Chromosome Analysis

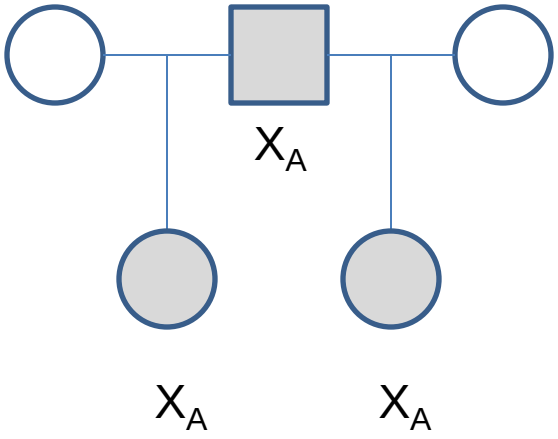
- Complex kinship cases involving at least one female
- Disputed paternity to a daughter (especially in motherless cases)
- Half-sister testing where the father is the common relative
- Grandparent—grandchild comparisons
- Paternity testing in incest cases



Paternal grandmother-granddaughter



Deficiency cases



Half-sisters testing

Investigator Argus X-12 Kit

X-STR Summary

- ChrX analysis has potential forensic and human identity testing applications due to its inheritance pattern compared to other genetic markers
- As with the rest of the human genome, STR markers are prevalent along the X-chromosome with comparable density to autosomal STRs
- A number of X-STR assays and kits are available
- Population studies are regularly published with X-STR data

Mitochondrial DNA (mtDNA)

Why Mitochondrial DNA?

- Mitochondria are organelles within cells
  - Produce energy via Krebs Cycle
- Separate genome from the nucleus (≈ 16,569 bp)
- Human cells have hundreds of mitochondria
- Between 2 – 10 genome copies per mitochondrion
  ≈ 1000 genome copies per cell
- A single cell's mtDNA can be amplified by PCR
  - 6 pg of DNA = 1 nuclear genome = 1000 mtDNA copies
  - When nuclear DNA fails to amplify, can often obtain mtDNA results
- In forensic samples quantity of evidence is sometimes a limitation
  - Trace evidence (hair, blood, bone)

http://remf.dartmouth.edu/images/mammalianLungTEM/source/8.html

Primary mtDNA Characteristics

- High copy number of mtDNA
- Maternal inheritance of mtDNA
- Lack of recombination
- High mutation rate compared to single copy nucDNA

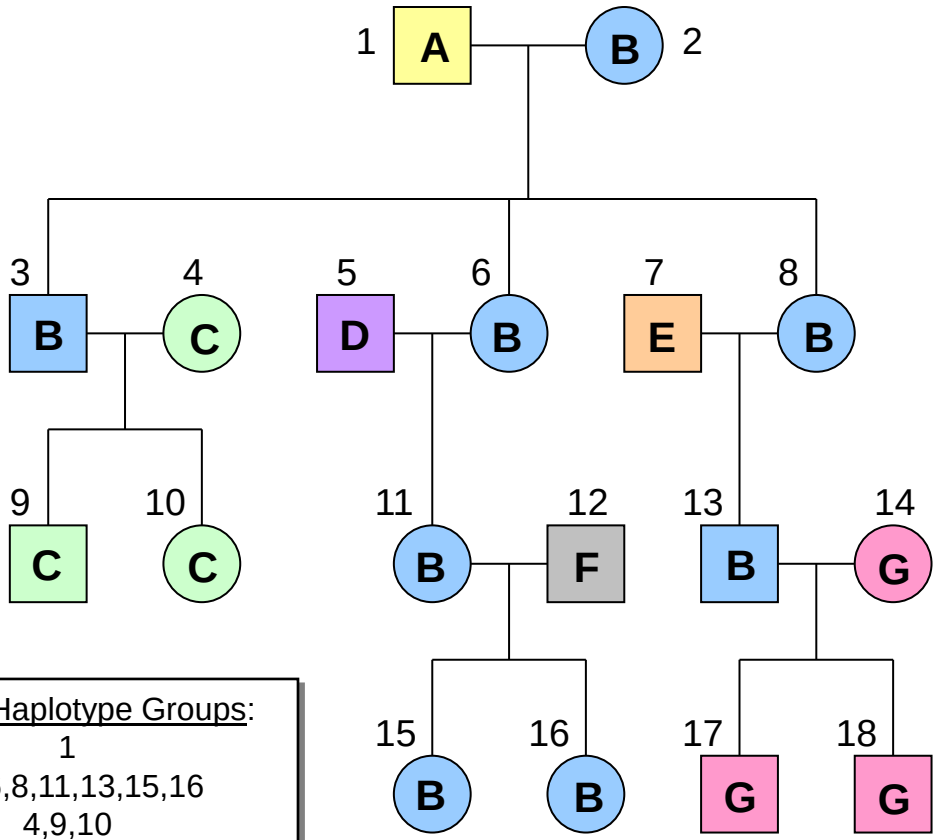
AFDIL “mini-primer” set

Maternal Inheritance of mtDNA

- Fertilizing sperm contributes only nuclear DNA
- Cellular components including the mitochondria in the cytoplasm come from the mother's ovum
- Any sperm mitochondria that may enter a fertilized egg are selectively destroyed due to a ubiquitin tag added during spermatogenesis
- Barring mutation, a mother passes her mtDNA type on to her children



MtDNA Haplotype Groups:

2,3,6,8,11,13,15,16

4,9,10

5

7

12

14,17,18

Candidates for mtDNA Testing

- Shed hairs lacking root bulb or attached tissue
- Fragments of hair shafts
- Aged bones or teeth that have been subjected to long periods of exposure
- Crime scene stains or swabs that were unsuccessful for nuclear DNA testing
- Tissues (muscle, organ, skin) that were unsuccessful for nuclear DNA testing

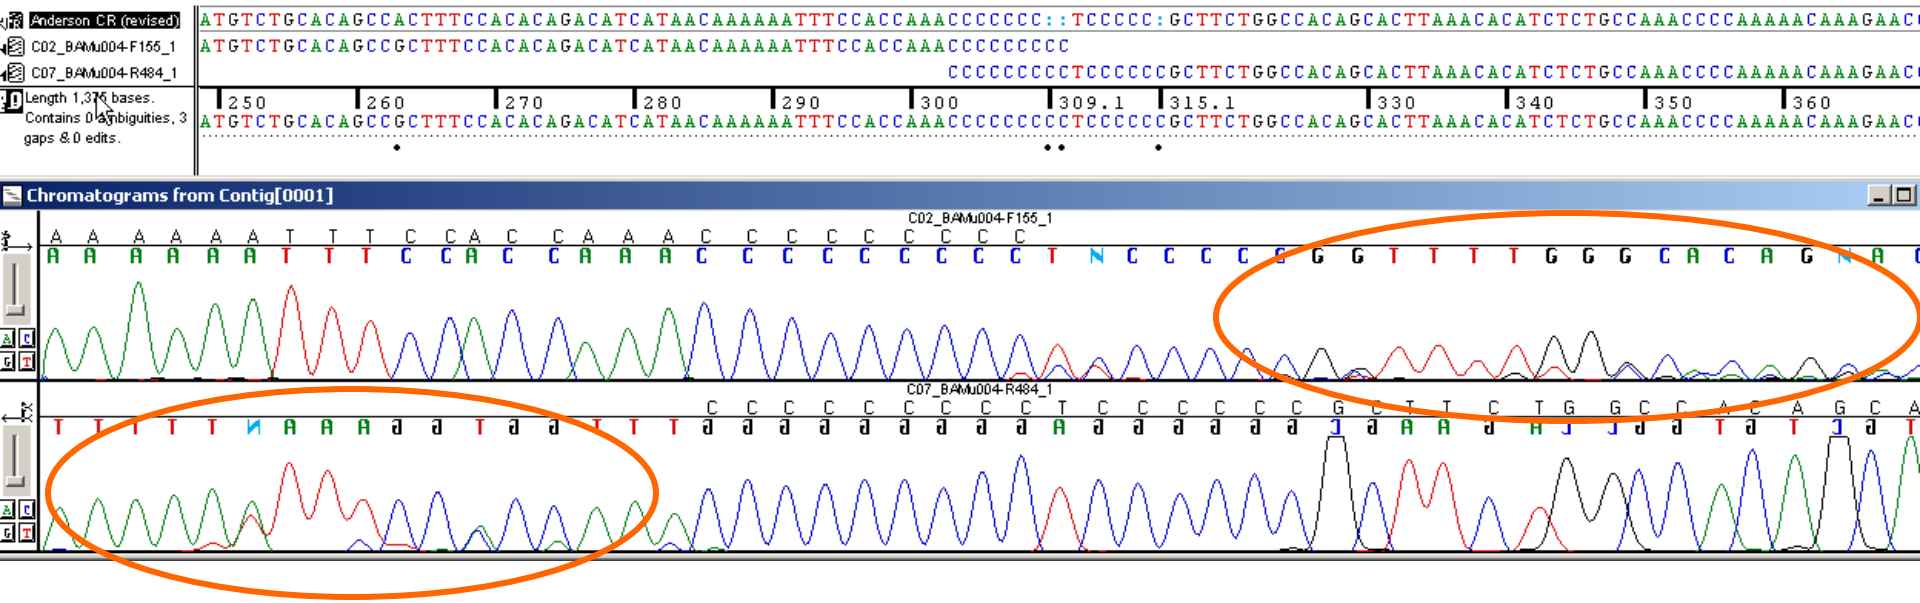
Interpretational Issues - Heteroplasmy

- Heteroplasmy – the presence of more than one mtDNA type in an individual
- Once thought to be rare, heteroplasmy exists (at some level) in all tissues
- Especially important in forensic mtDNA analysis of hair

HV2 Length Heteroplasmy



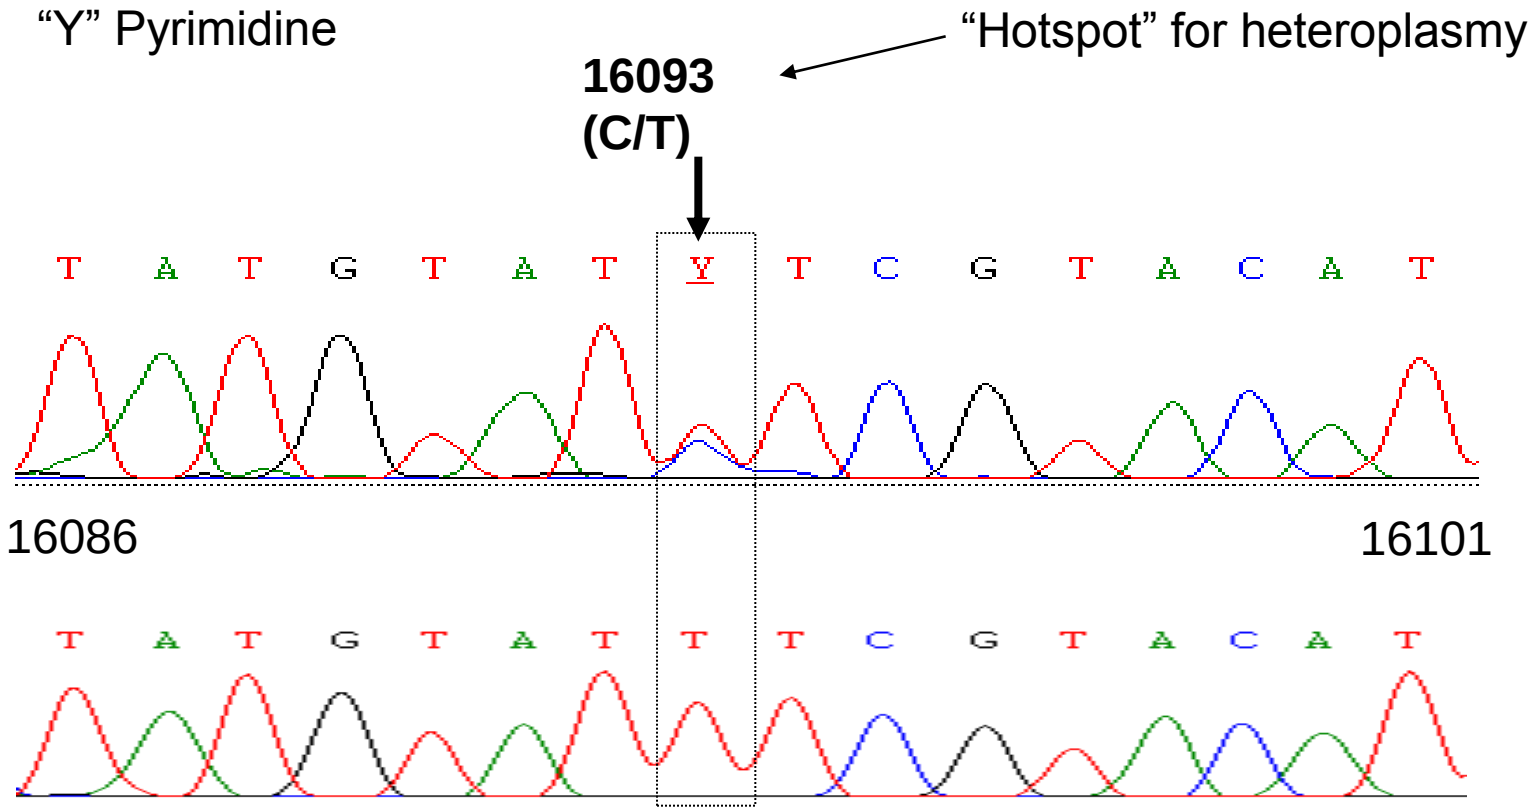
"Out of phase!"

Sequence 1 AAACCCCCCCCTCCCCCCGCTTC

Sequence 2 AAACCCCCCCCCTCCCCCCGCTTC

Sequence 3 AAACCCCCCCCCCTCCCCCCGCTTC

Point Heteroplasmy



Origination of Heteroplasmy

Ovum – 100K mitochondria

↓

Very little mito growth until implantation

↓

Females – produce ~7 million ova during fetal development only a few hundred become mature oocytes

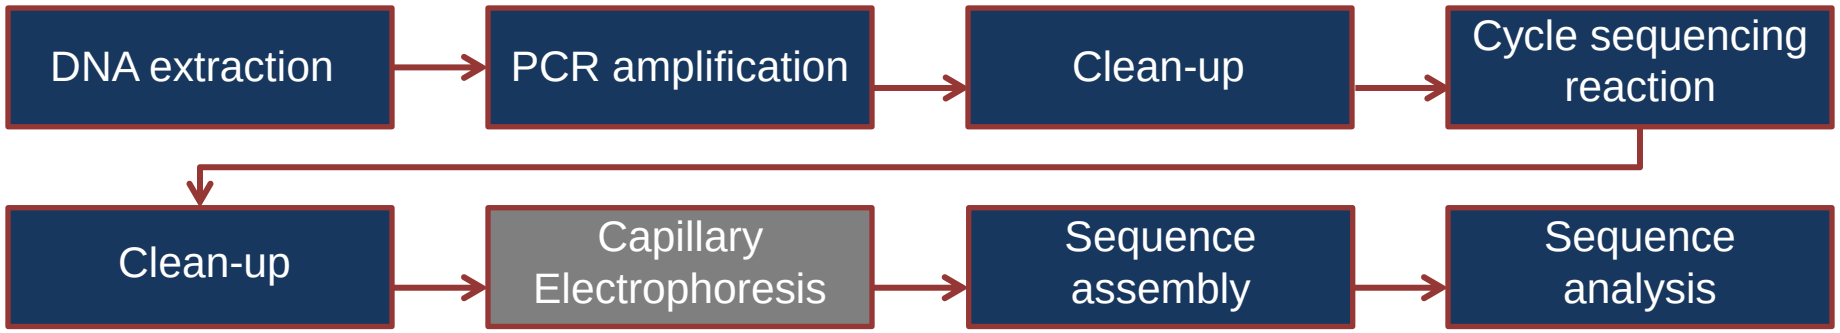
mtDNA Base Composition Analysis by Mass Spectrometry

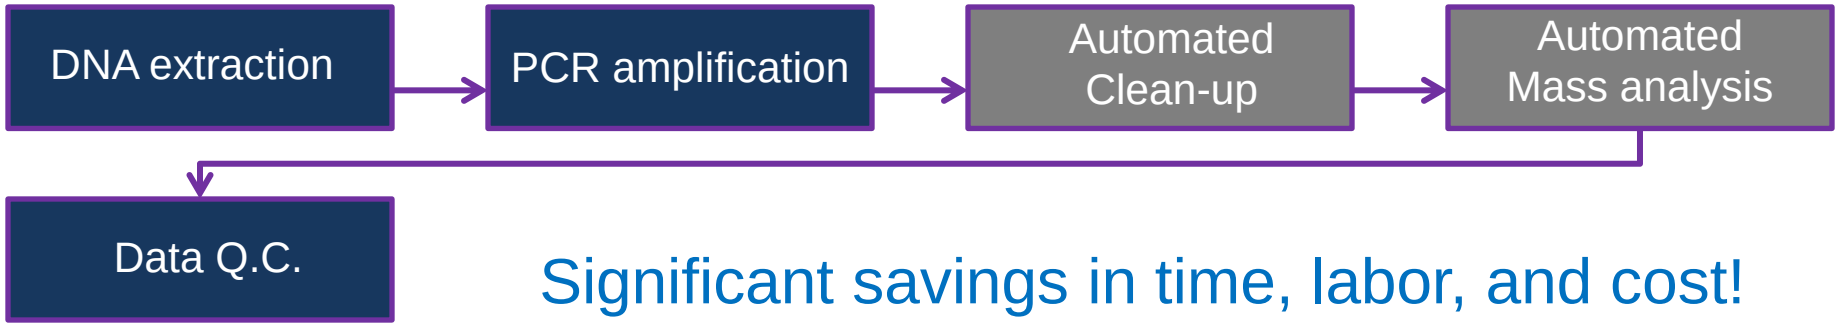
Kevin Kiesler provided slides and performed NIST work

Sequencing vs. Mass Spec



Sanger sequencing Cost: **$300** per sample Time: **10** hours

Plex-ID system Cost: **$185** per sample Time: **5** hours



Significant savings in time, labor, and cost!

Key:

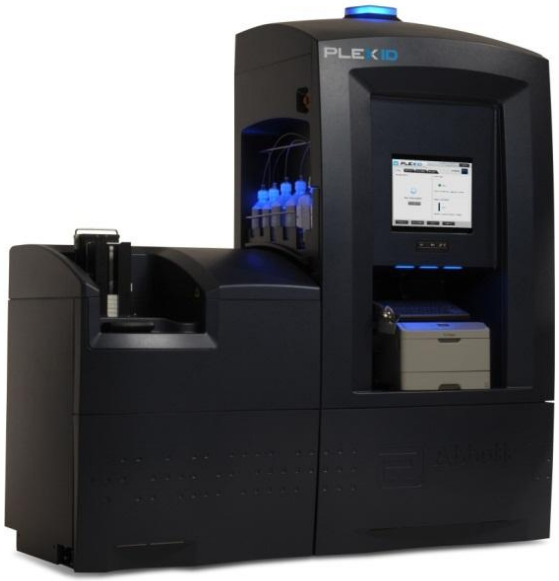
Manual step

Automated step

Base Composition by Mass Spectrometry

- Electrospray is a soft ionization method
  - Does not fragment molecules
  - Dissociates strands of DNA (PCR product)
  - 5 kV ionization negatively charges DNA (multiple charge states)
- Masses of forward and reverse strands measured
  - Time of flight analyzer
  - Mass/charge ratio (m/z) is result

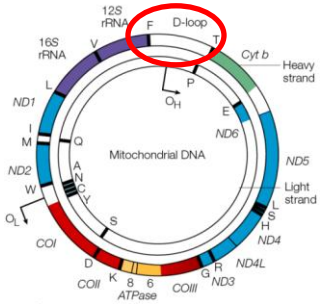
Plex-ID Instrument

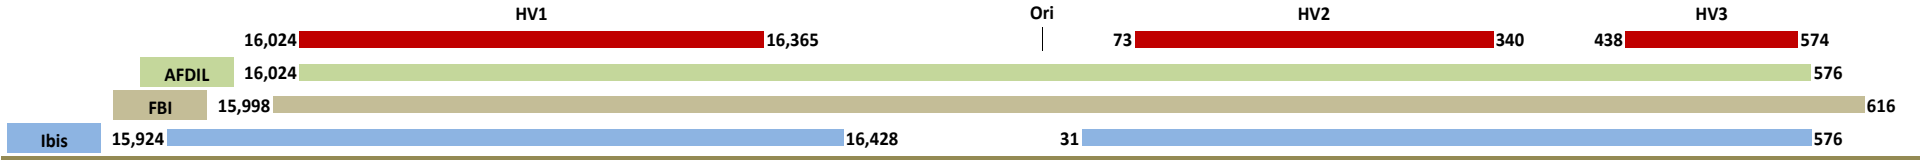


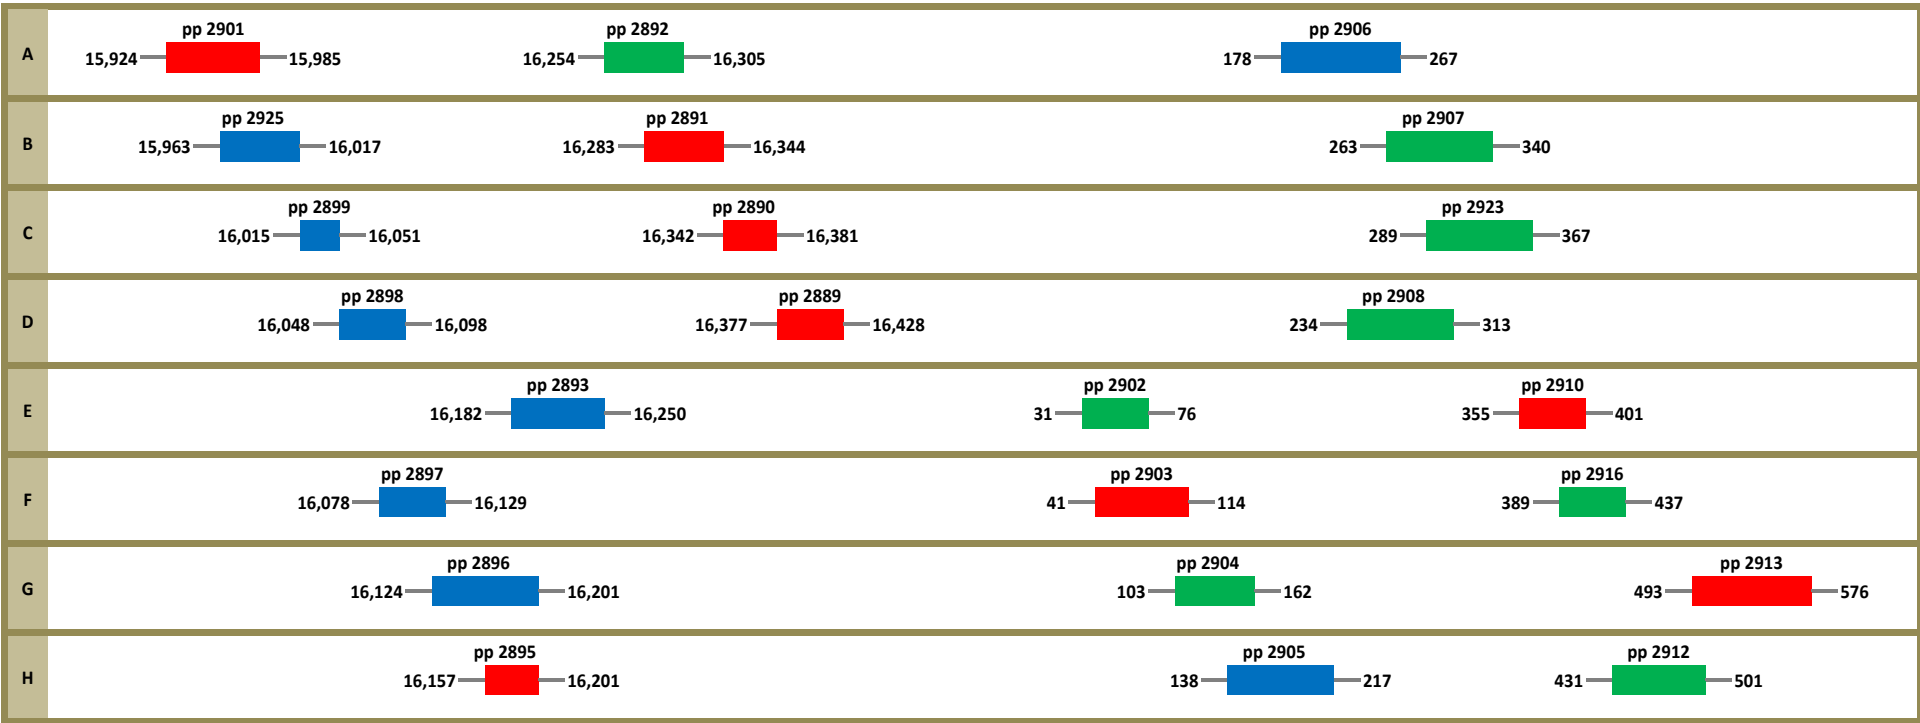
- Automated DNA cleanup
- Closed system

mtDNA 2.0 Triplex PCR Reactions

- The control region is amplified by 24 PCR primer pairs in eight triplex PCR reactions
  - Tiled over HV1, HV2, and HV3
  - Each nucleotide position is assayed at least once







mtDNA 2.0 Assay from Ibis Biosciences

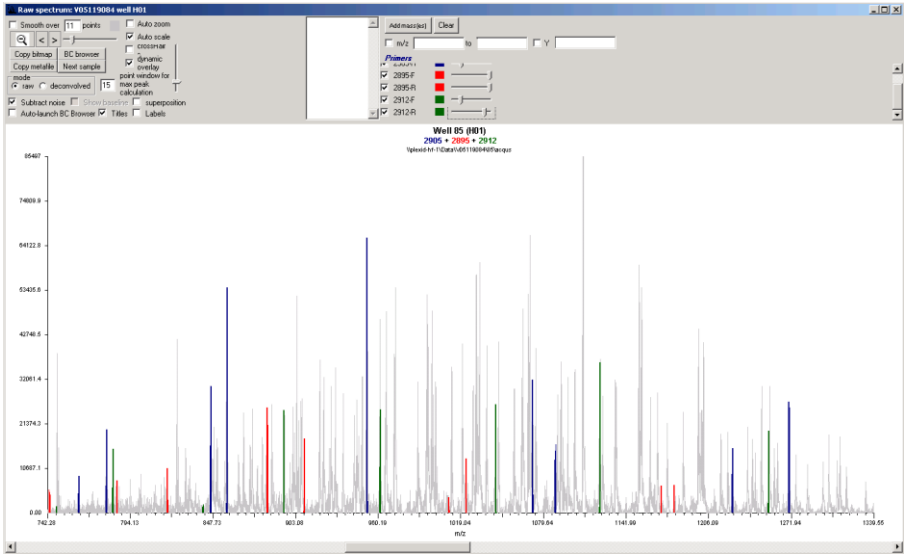
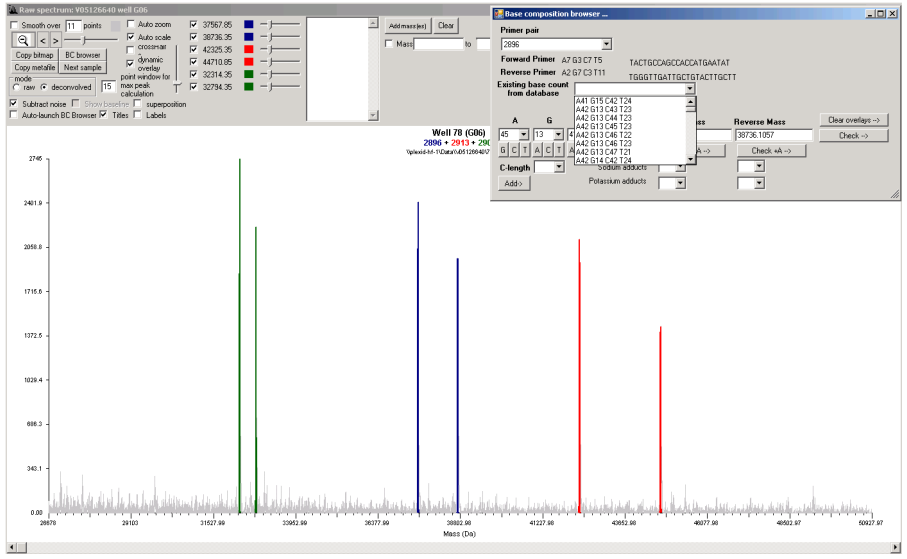
- Prefabricated 96-well plate contains all reagents for amplification
- Each well in plate contains 3 PCR primer pairs (24 amplicons total)
- For each sample, 5 µL is placed in 8 wells in a column (A - H)
- PCR is cycled off-platform then loaded onto the PlexID input stacker
- PCR products are desalted with magnetic bead-based purification
- Automated cleanup and injection is performed by the instrument
- Up to 15 plates can be processed in a single, fully automated run

Results – Mass Spectra

- Complex spectrum of multiple charge states of DNA are deconvolved into simplified spectrum

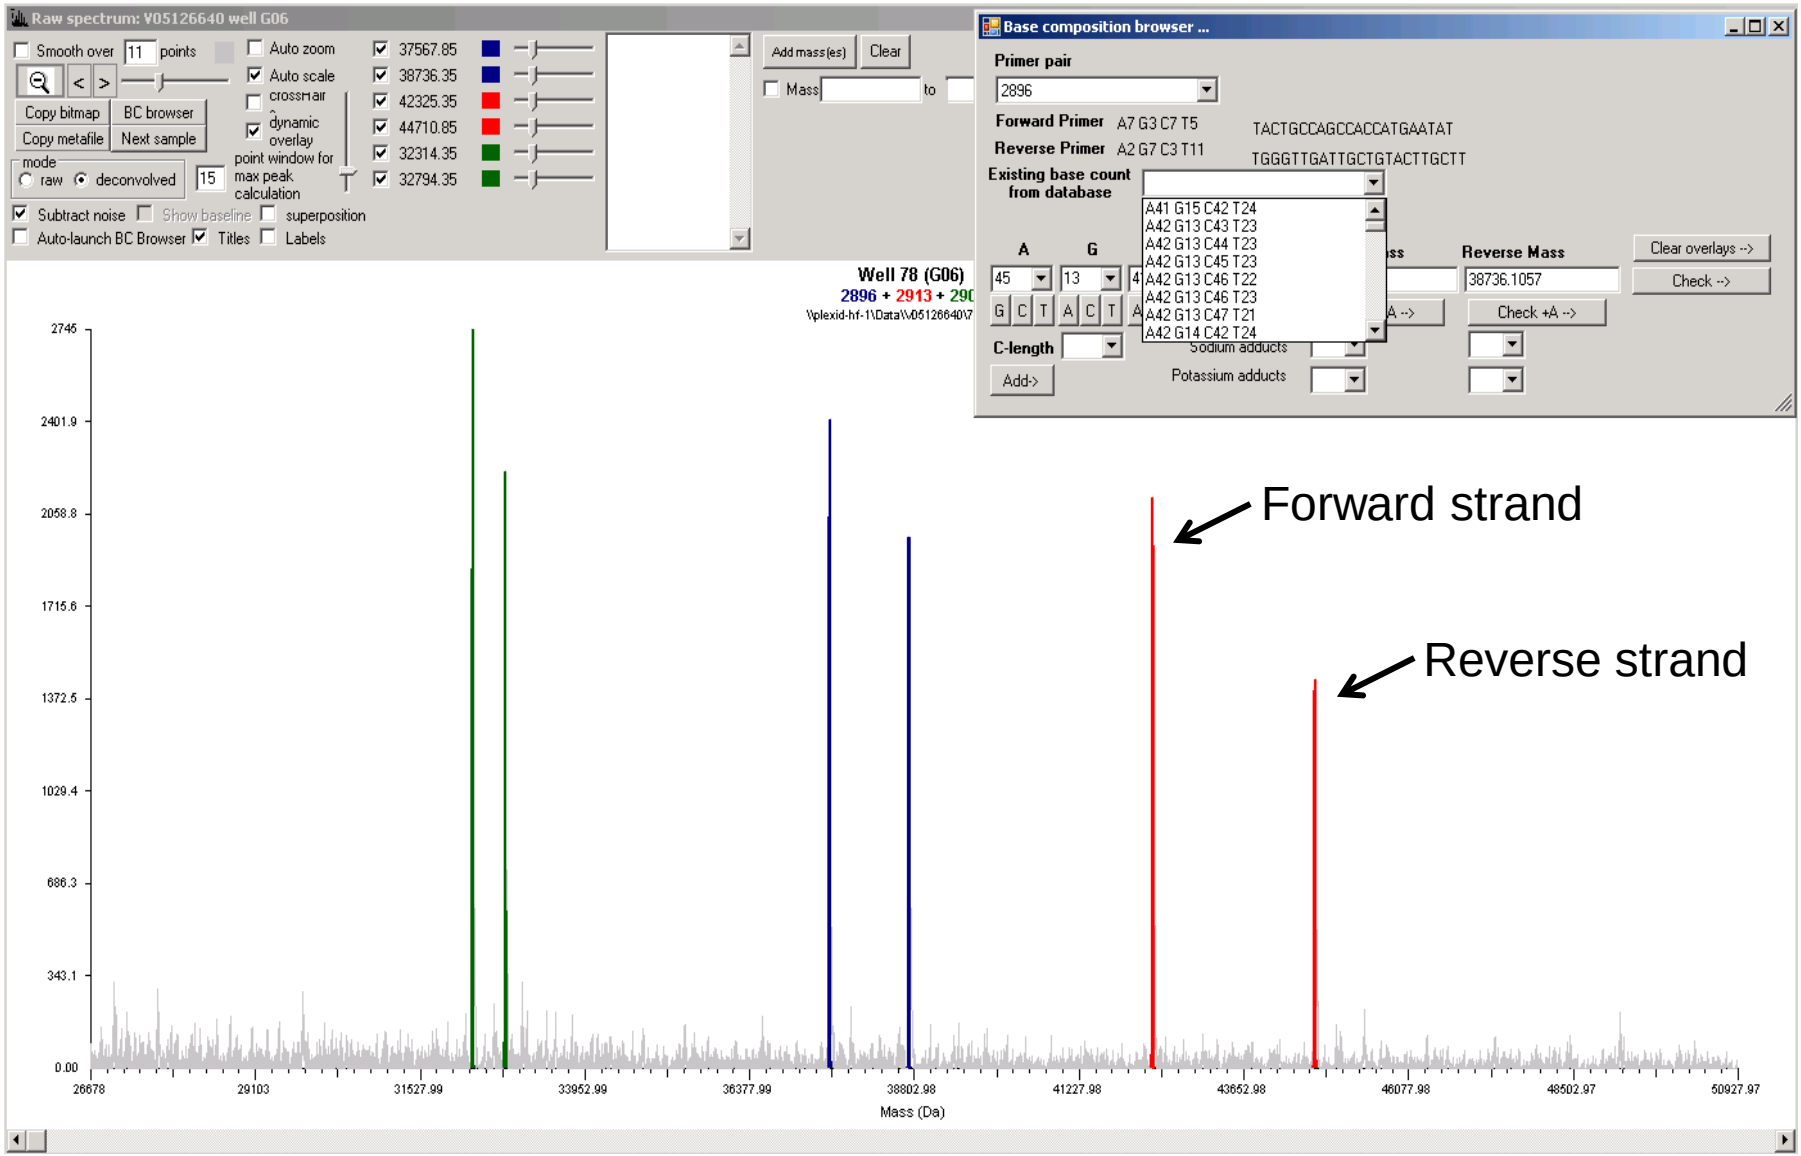


Raw Data



Processed Data

Results – Mass Spectra



Assigning Base Compositions to Mass Measurements

- Forward and reverse strands of PCR amplicons are measured independently (1)
- Watson-Crick reverse complement rules are applied to confirm that the two measured strands are from the same PCR product (2)
- Masses are correlated to a reference database of known base compositions in order to arrive at a measured base composition (3)
  - Combined base compositions of 24 amplicons are the “profile”
  - Can be used to search databases for matching profiles

A35 G15 C25 T31

DNA Mass Spectrometry Limitation: Masses of Natural Nucleotides

- When A -> G & T -> C polymorphisms are present within an amplicon, the mass difference is +1 Dalton compared to the reference sequence
  - Cannot be differentiated by mass spec
  - **A -> G** (329.2 – 313.2 = +16 Da)
  - **T -> C** (289.2 – 304.2 = - 15 Da)
  - **tagctagctgacgatcgatgctag** mass = 7455 Da
  - **tagctagctgGcgatcgaCgctag** mass = 7456 Da

- To resolve this limitation, the assay uses a G nucleotide labeled with heavy carbon isotope, ^{13}C
  - Adds 10 Da to the mass of the nucleotide
  - Eliminates the ambiguity in combinations of nucleotide masses
  - **tagctagctgacgatcgatgctagctag** mass = **7525 Da**
  - **tagctagctgGcgatcgaCgctagctag** mass = **7536 Da**

Base Composition vs. Sequence

- Sequencing results in an ordered string of bases
  - AAGAGGTTTCACCCTGGTT
- Base composition yields an empirical formula of bases without knowing the order
  - $A_4G_5C_4T_6$
- The signature of 24 amplicons' base comp signature is almost as unique as sequence
  - Difference: cannot resolve reciprocal base changes within one amplicon
  - Example: C -> T + T -> C = no change in mass

Improved extraction protocols for mtDNA testing

Short communication

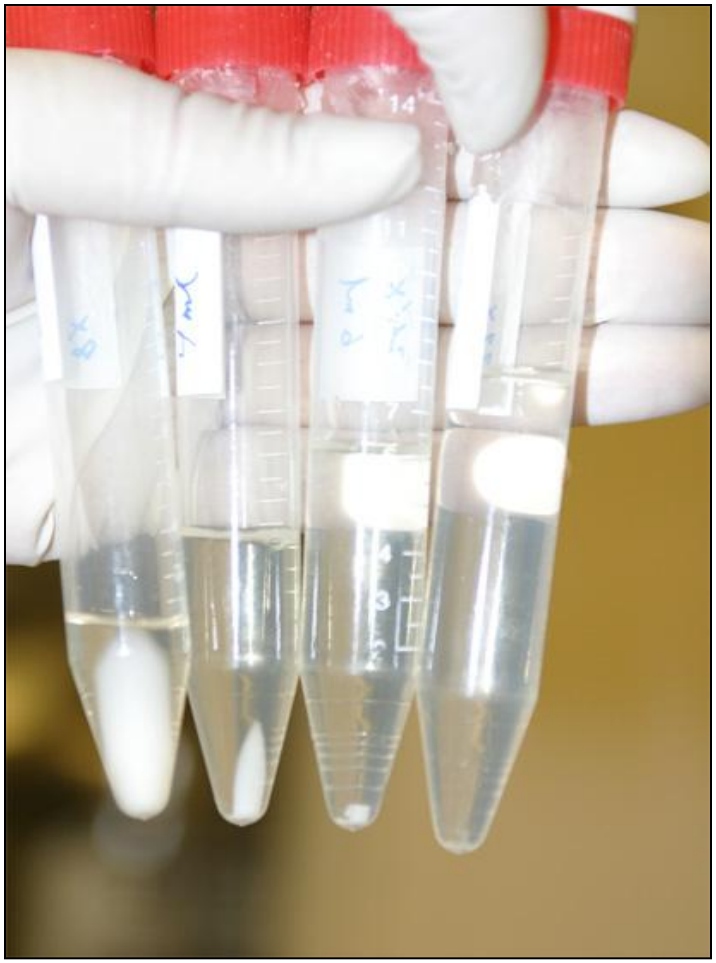
High efficiency DNA extraction from bone by total demineralization ☆

Odile M. Loreille *, Toni M. Diegoli, Jodi A. Irwin, Michael D. Coble, Thomas J. Parsons [1]

Armed Forces DNA Identification Laboratory, 1413 Research Blvd., Bldg. 101, Rockville, MD 20850, United States

Received 24 January 2007; accepted 3 February 2007

Demineralization protocol



- EDTA 0.5M, pH 8.5
- Detergent
- Proteinase K
- 1g powder

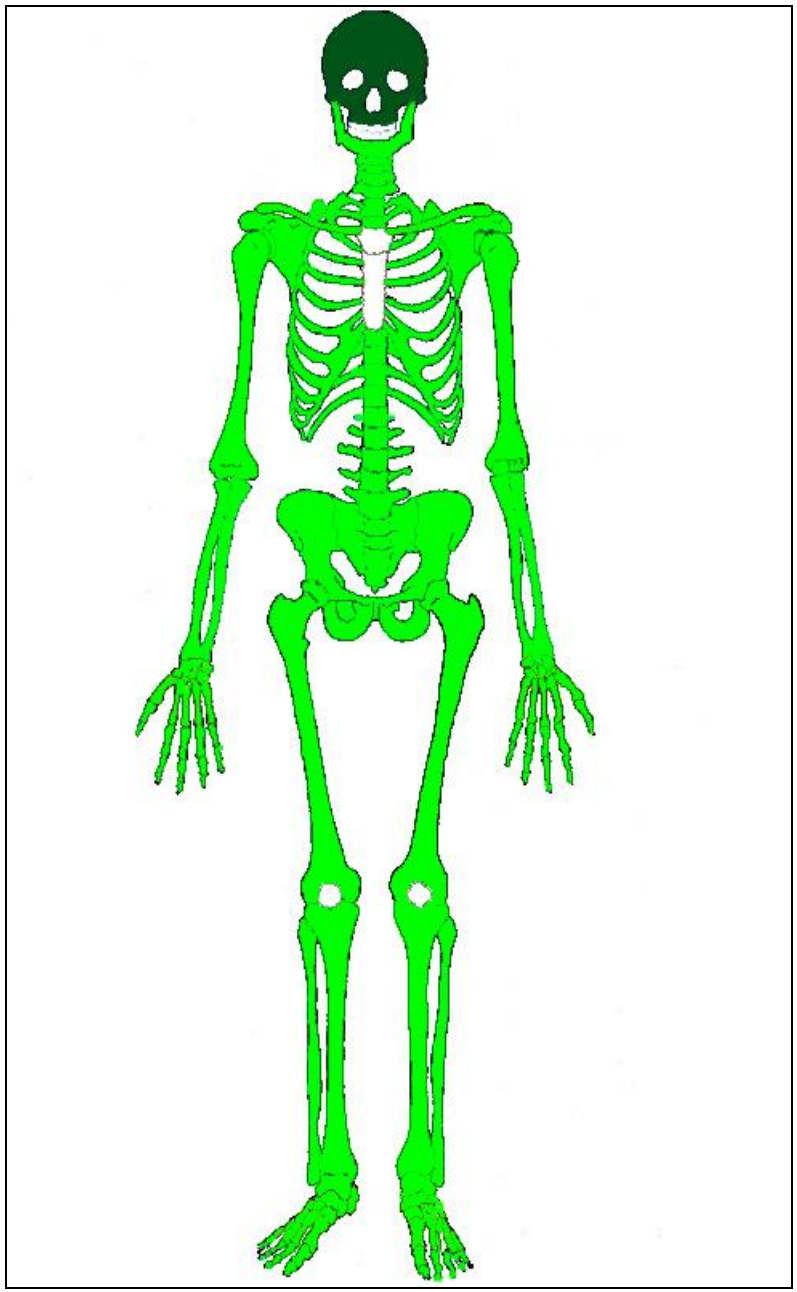
15ml extraction buffer

- Organic extraction (phenol-chloroform)
- Concentration and washes in filtration devices.

Casework SOP

Demineralization protocol

10mM Tris, pH 8.0, 100mM NaCl, 50mM EDTA, pH 8.0, 0.5% SDS; ProK



- 90-100% success
- 80-89.9% success
- 70-79.9% success
- 60-69.9% success
- 50-59.9% success
- 40-49.9% success
- 30-39.9% success
- 0-20% success

Demineralization success

736 samples processed
